Seals and Sealing Systems for Presses

Leading the way.

Seals and Sealing Systems for Presses

Installation recommendations for sealing systems plus descriptions with dimension tables of products used predominantly in all kinds of presses applications.

Leading the way.

The figures indicated in the catalog are based on experiences gathered within the Freudenberg Group in the field of research over several decades for the development and manufacture of seals and they are in line with today's state-of-the-art expertise. However, the sealing effect provided by numerous products mentioned in the catalog is not only generated by the component proper. It is rather based to a very large extent – depending on the specific application involved – on other parameters such as the place of installation and counter rotation, the pressure applied, the operating temperature, the media to be sealed, the lubrication, vibration-related influences and possible dirt from outside. These

and further unknown factors are likely to exert a tangible influence on the function of seals in practical applications.

Against this background, no standard statements can be made about the function of the products mentioned in the catalog. The data stated in the latter merely represent general, non-binding reference values which cannot be applied to every case of application. As a result, we recommend that you discuss concrete cases of application with our consulting services.

In the event of higher and special stresses, e.g. exerted by aggressive media, the seal should be selected in cooperation with us, as functional reliability tests are frequently indispensable.

Sectoral Solutions

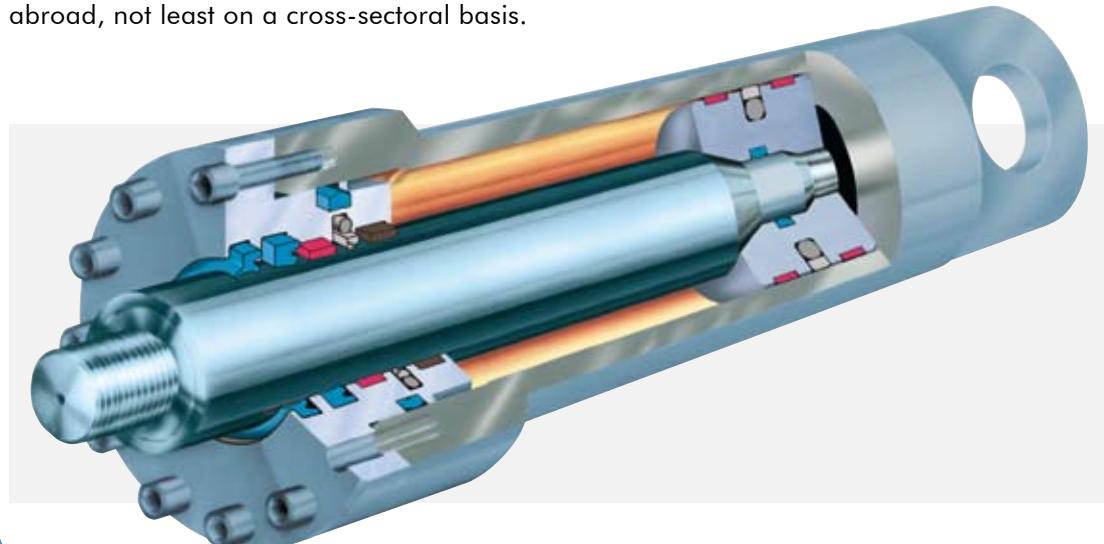

Merkel Seals and Sealing Systems for Presses

Merkel: sealing technology acknowledge worldwide

Merkel is the market leader in the field of seals for heavy industry. With innovative solutions and definitive products for all sectors, we rank among the world's best-thought-of experts on sealing technology. The quality of Merkel seals is recognized worldwide.

Their high functional reliability, coupled with excellent static and dynamic sealing effects, is regularly confirmed in comparative tests by all our customers at home and abroad, not least on a cross-sectoral basis.

For customized solutions to challenging problems, take advantage of our expertise in applications engineering, our profound expertise in material selection in conjunction with Freudenberg Research Services, and our sophisticated production technology.

Merkel seals: meeting all requirements

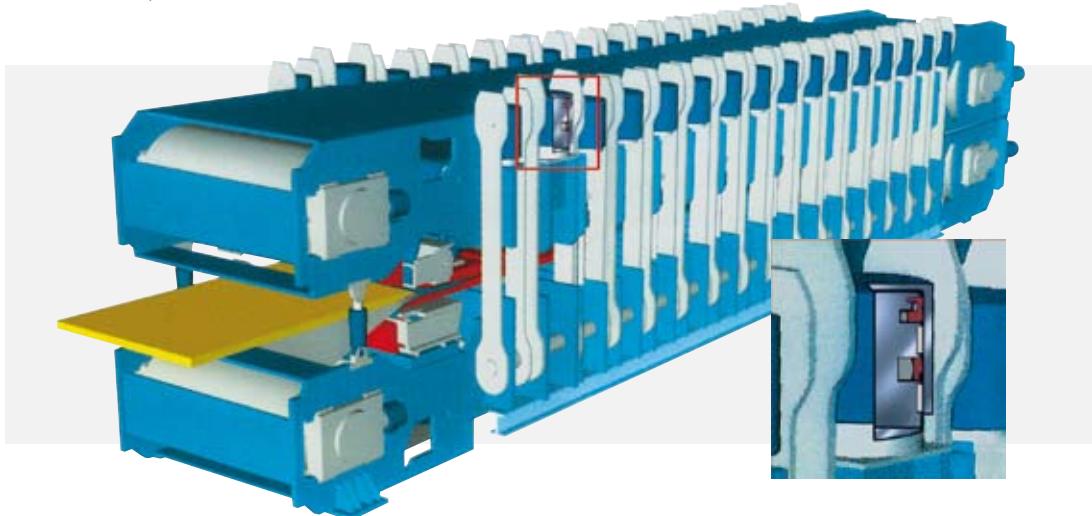

Merkel sealing systems are renowned for their outstanding material quality, coupled with high extrusion stability and a perfectly matched geometry.

Absolute performance under high pressures, at high speeds or in adverse weather is a matter of course for Merkel sealing systems. With Merkel sealing systems your processing equipment will operate

- a lot faster
- better
- more economic
- and safer.

Merkel Heavy Industry is one of the leading manufacturers of sealing systems for the heavy industry.

Major plant engineering and construction companies in the presses industry rely on the outstanding quality of Merkel products and the high standard of Merkel sealing technology. Close cooperation during development projects ensures a realisation that is close to the market, field-exprienced and tailor-made for the application, even in harsh environments.

This will not only give you the cutting edge, but will result in less downtime, less maintenance and significantly reduced repair costs.

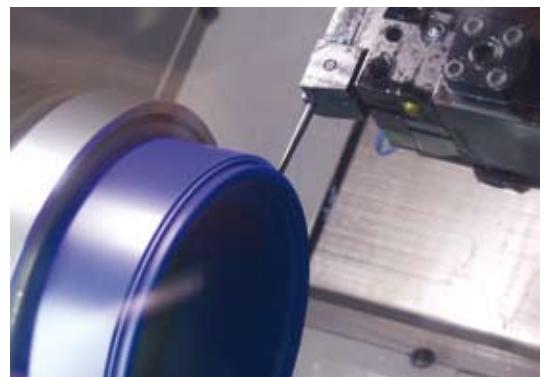

Take advantage of our superior product range for your systems, and rely on the expertise and know-how of a leading company.

Customized, field-proven, cost-efficient: the best sealing system for every requirement

Diverse operating conditions and the associated high requirements of sealing systems like:

- low frictional forces and good control liability
 - high reliability
 - long service life
 - optimal leakage behaviour
- often require customer-specific solutions. Merkel has specialised in this area and is one of the globally leading suppliers of seals and sealing systems particularly for large dimensions.

Development work is a crucial element in our globally successful product policy. The ideal sealing effect is offered to you by the Omegat rod seals OMS-MR PR and OMS-S PR. With the patented pressure-relief feature, the pressure in the intermediate space is held independently of the operating conditions at a level favorable for continuous operation. By virtue of the low thermal and mechanical stress on the sealing elements, a stable long term behavior is achieved, and the sealing system's service life is extended.

We offer sophisticated and high quality seals and sealing systems for a diverse number of applications:

- in the metal processing industry (cold):
- i. e. bending- extrusion- and deep drawing presses
- in metal processing (hot)
- i. e. forging presses and forging hammers
- in the scrap industry
- i. e. scrap shears- and presses
- for the building industry
- i.e. ceramic- and brick presses
- for wood processing
- i. e. chipboard- and veneer presses
- for paper processing
- i. e. baling presses

Merkel offers you firstly a high level of stock availability from conventional production methods, and secondly a fast-response capability for rush repair jobs, based on state-of-the-art lathe technology.

Merkel seals: Your competitive advantage

Due to their high extrusion resistance and their superior material quality, Merkel seals have no trouble standing up to high speeds and a wide range of temperatures. This means your machines can produce not only faster, but at significantly higher efficiencies into the bargain.

The superior sealing effect can be relied upon to prevent leaks and resultant machine failures, thus saving you costly downtimes. At the same time, both service and repair outlays are reduced.

About: Merkel

Around 800 employees develop, produce and sell seals and sealing systems for industrial applications.

Merkel Freudenberg Fluidtechnic belongs to the Freudenberg Seals and Vibration Control Technology business unit, forms part of the globally operating Freudenberg Group, and is thus integrated into one of the world's biggest global partnership and sales networks for sealing technology.

Typical applications

Sealing Systems for Presses

Merkel supplies compact sealing systems that ensure reliable sealing even under the extreme conditions encountered in the wide field of the presses industry. The individual elements involved are optimally matched in terms of both materials and functionality,

since all individual seals are developed as a system solution, and supplied from a single source. By selecting materials specifically matched to these requirements, a very high pressure resistance capability is achieved, assuring long, functional life.

Sealing Arrangement for Rod Seal (plunger)

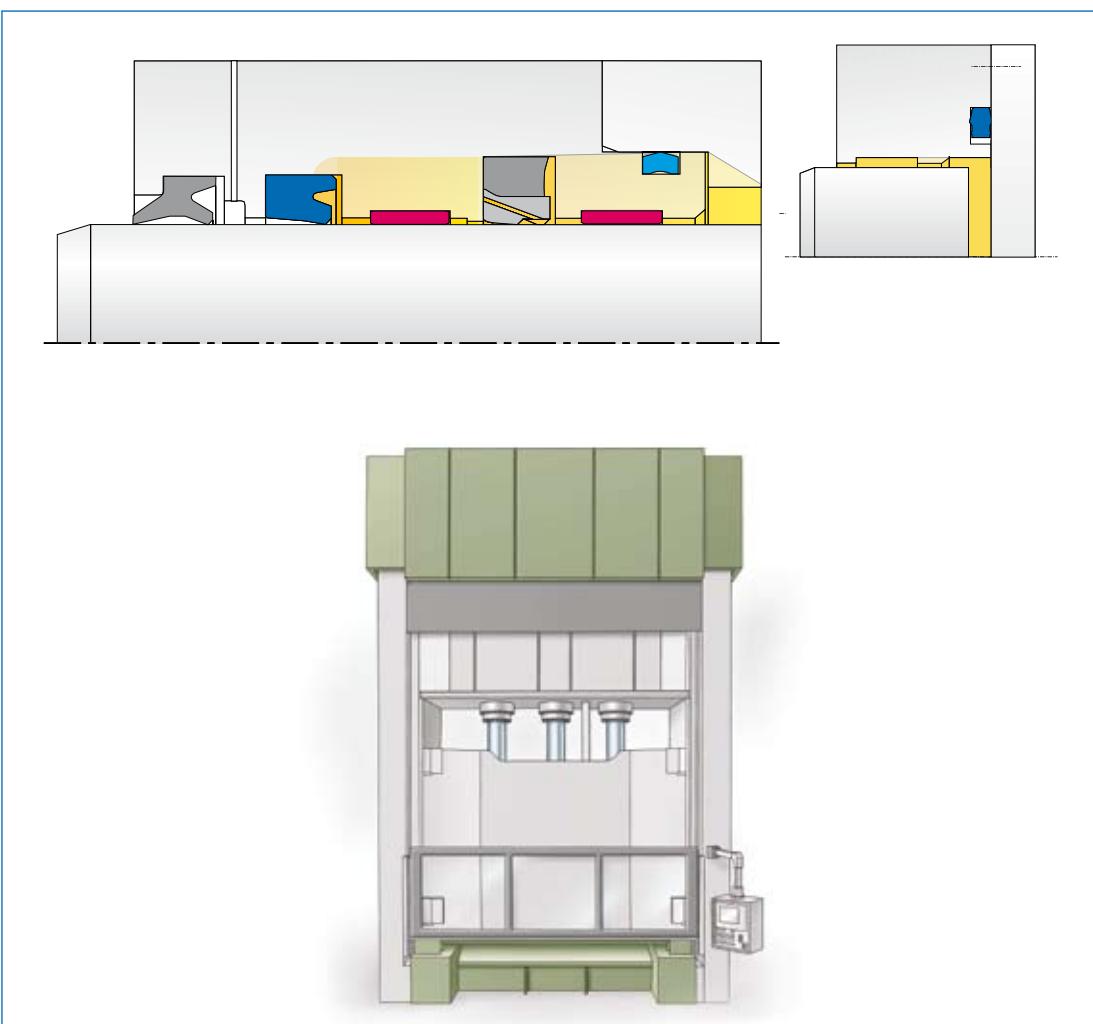

Applications:
Metal forming press,
particleboard press, pipe forming press

Merkel rod seal systems with doublewiper P 9, primary seal Omegat OMS-S PR, secondary seal U-Ring T 20, Guivex guide bushes SBK and Cover Seal PU 83 respectively Stircomatic SRC.

Requirements for the sealing system:

- Large diameter
- Long stroke
- High pressure

Typical operating parameters	
Diameter of the rod	700 mm
Movement	linear, downward out stroke
Pressure	30 MPa
Speed	loaded 0,02 m/s; without load 0,5 m/s
Stroke	loaded 400 mm; without load 2500 mm
Medium	mineral oil

Sealing Arrangement at Environmental Influence

Applications:

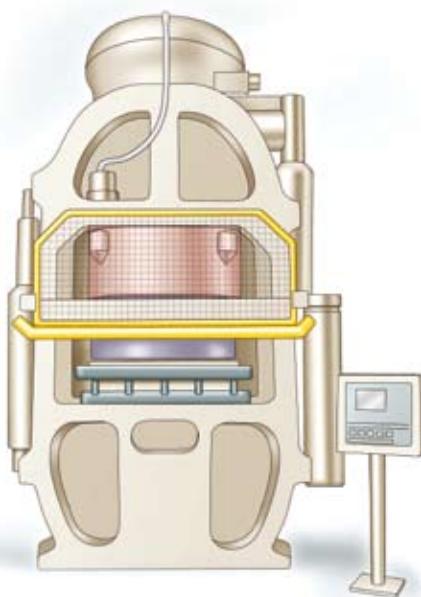

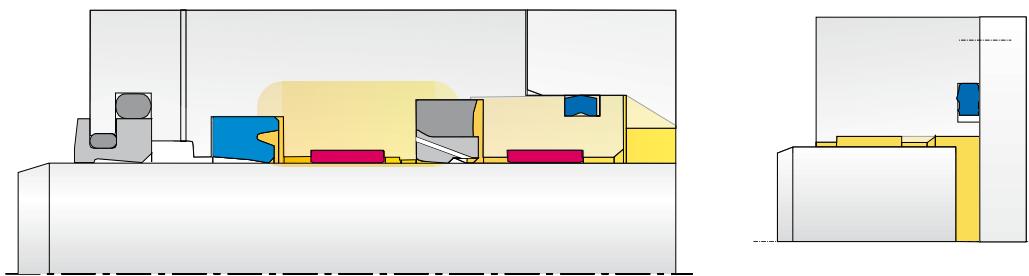

**Particleboard press, short cycle press,
stone press, ceramic press**

Merkel Rod Sealing System with double wiper PT 2, primary seal Omegat OMS-S PR, secondary seal U-ring T 20, Guivex guide bushes SBK and Cover Seal PU 82 respectively Stircomatic SRC.

Requirements for the sealing system:

- Adherent pollution to the rod
- Fluid and dirt from the top
- Aggressive steam
- Radiant heat

Typical operating parameters	
Diameter of the rod	700 mm
Movement	linear
Pressure	30 MPa
Speed	loaded 0,02 m/s; without load 0,5 m/s
Stroke	loaded 400 mm; without load 2500 mm
Medium	mineral oil

Sealing Arrangement for Water Based Pressure Fluids

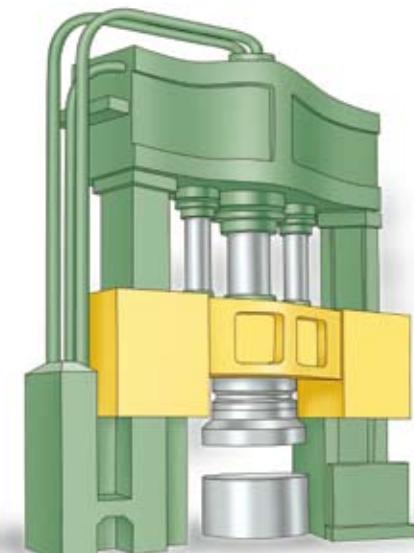

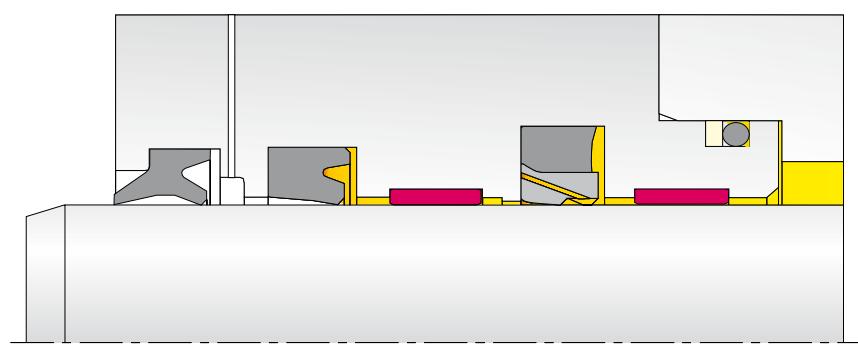

Applications:

Forging press, metal forming press,
particleboard press

Merkel Rod Sealing System with double-wiper P 9, primary seal Omegat OMS-S PR, secondary seal U-ring L 20, Guivex guide bushes SBK and an O-ring with a PTFE back-up ring

Requirements for the sealing system:
■ Fire-resistant pressure fluids (HFA)

Typical operating parameters	
Diameter of the rod	700 mm
Movement	linear, downward out stroke
Pressure	30 MPa
Speed	loaded 0,02 m/s; without load 0,5 m/s
Stroke	loaded 400 mm; without load 2500 mm
Medium	water emulsion (HFA)

Sealing Arrangement for Existing Seal Housing with Optimized Sealing System

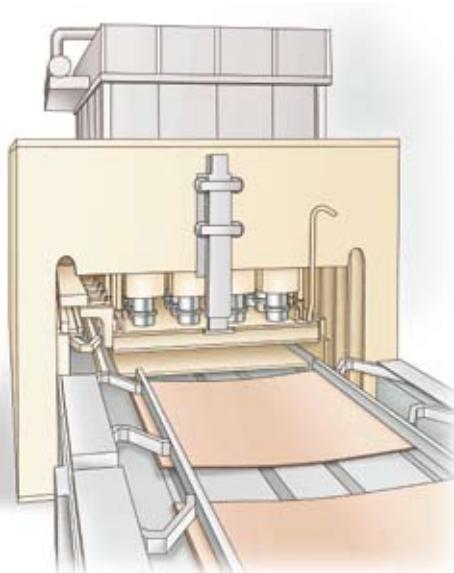

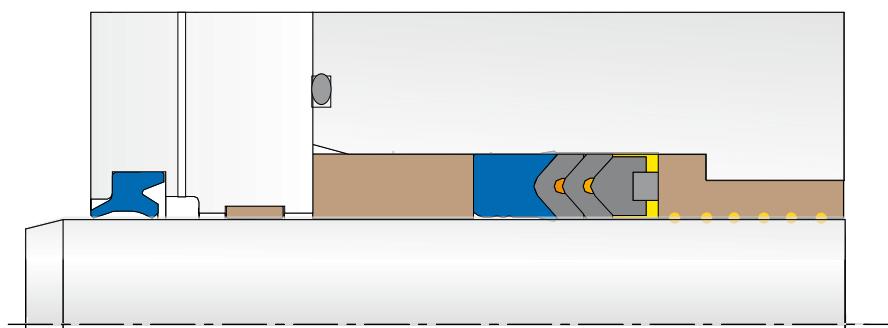

Applications: Short cycle press

Merkel rod sealing system with double wiper PU 11, roof shaped seal set ES 81 with a polyurethane pressure ring, PTFE bronze guide band SF and an O-ring.

Requirements for the sealing system:

- Main working pressure at the end of the stroke
- Partial vacuum
- Short-term rise in pressure

Typical operating parameters	
Diameter of the rod	400 mm
Movement	linear, downward out stroke
Pressure	loaded 32 MPa; temporary (low-pressure) -0,09 MPa
Speed	loaded 0,02 m/s; without load 0,5 m/s
Stroke	loaded 2 mm; without load 300 mm
Medium	mineral oil

Sealing Arrangement for Differential Cylinder

Applications:

Metal forming press, bending press, working cylinder in general

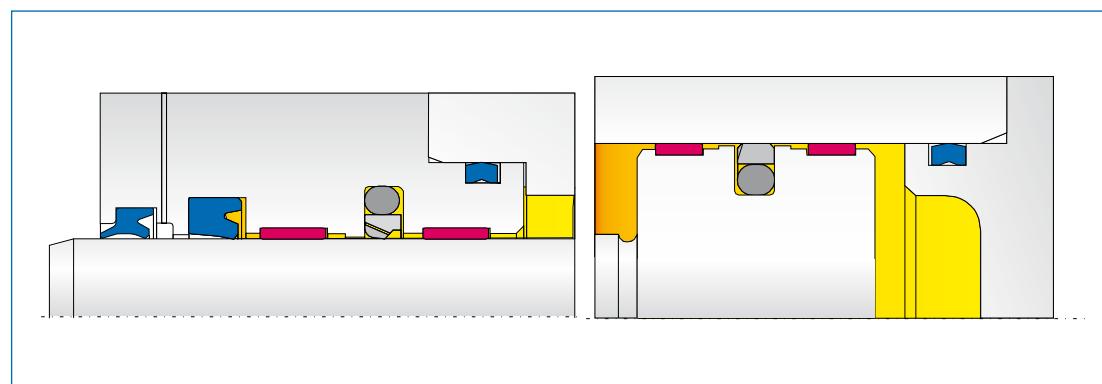

Merkel rod sealing system with double wiper PU 11, primary seal Omegat OMS-MR PR, secondary seal U-ring T 20, Guivex guide bushes SBK and Cover Seal PU 83.

Merkel piston sealing system with Omegat OMK-MR, Guivex guide bushes KBK and Cover Seal PU 83.

Requirements for the sealing system:

- long stroke

Typical operating parameters	
Diameter of the rod	rod: 200 mm piston: 250 mm
Movement	linear, downward out stroke
Pressure	rod: 16 MPa piston: 30 MPa
Speed	loaded 0,01 m/s; without load 1 m/s
Stroke	loaded 200 mm; without load 1600 mm
Medium	mineral oil

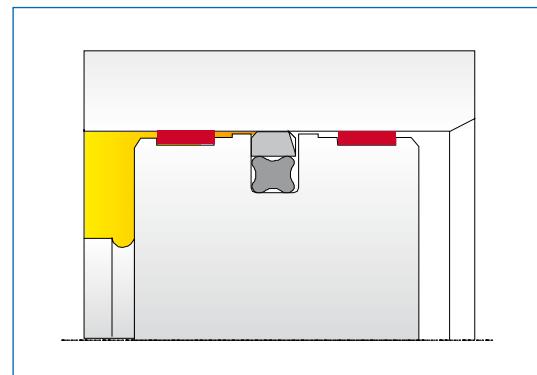

Alternative:

Merkel piston sealing system with Omegat OMK-QR and Guivex guide bush KBK.

Depending on the operating conditions, reciprocal load may cause twisting of the O-ring used as preload element.

In this case the O-ring of the piston seal set series Omegat OMK-MR can be replaced by an X-ring. The Omegat piston seal including an X-ring as preload element is described as piston seal set series Omegat OMK-QR.

The Omegat OMK-QR is used for pistons with pressure from both sides and heavy duty applications.

Sealing Arrangement under Rough Environment

Application:
Baling press, scrap press

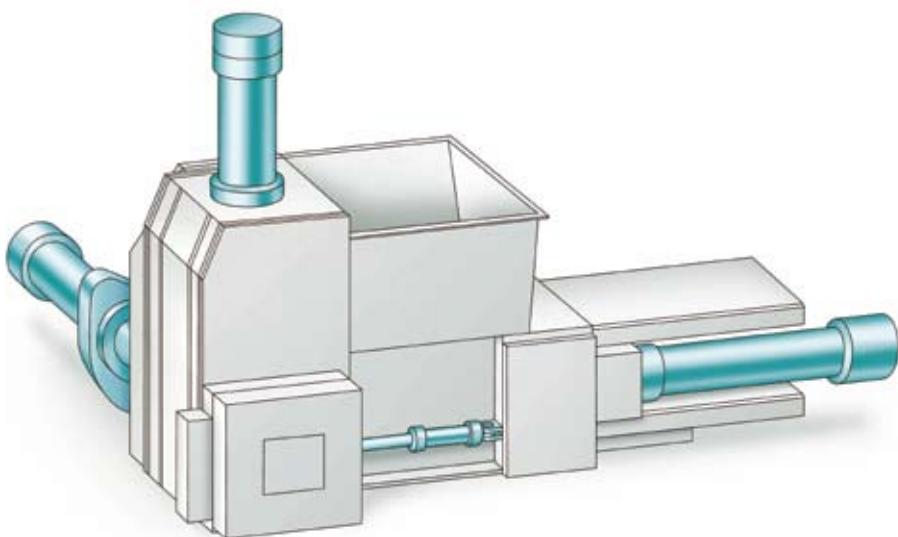

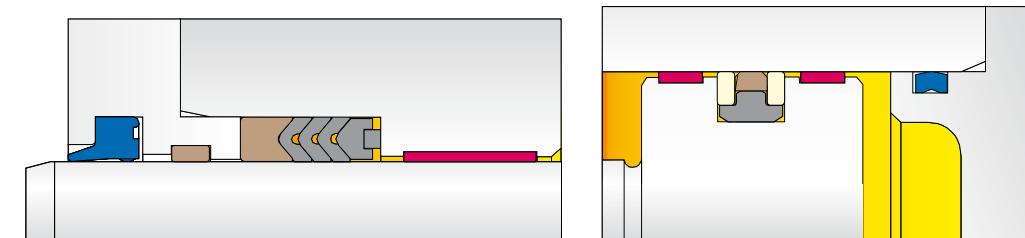

Merkel rod sealing system with wiper PU 6, roof shaped seal set ES 61 with a PTFE Bronze pressure ring, Guivex guide bush SBK and PTFE bronze guide band.

Merkel piston sealing system with the compact seal L 27, Guivex guide bushes KBK and Cover Seal PU 83.

Typical operating parameters	
Diameter	rod: 200 mm piston: 280 mm
Movement	linear, horizontal out stroke
Pressure	rod: 10 MPa piston: 30 MPa
Speed	0,3 m/s
Stroke	up to 10000 mm
Medium	mineral oil

Requirements for the sealing system:

- Robust
- Large gap size to prevent metal contact

Sealing Arrangement for the Application in Short Stroke Presses

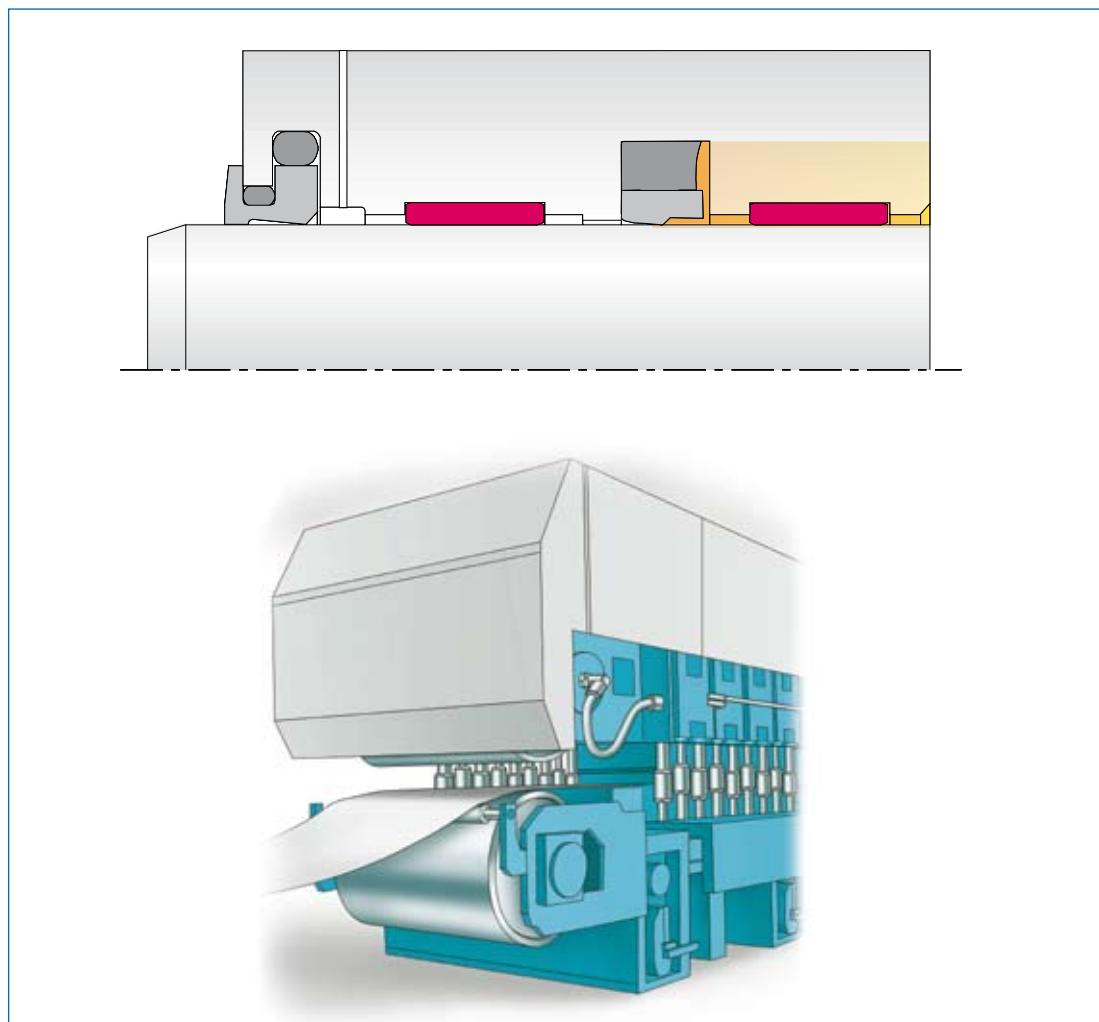

Application:
Continuous particleboard press,
fine blanking press

Merkel rod sealing system with double wiper
PT 2, rod seal Omegat OMS-S und Guivex guide
bushes SBK

Requirements for the sealing system:

- Short stroke
- Short cycle time
- Partly remaining under pressure

Typical operating parameters	
Diameter	400 mm
Movement	linear, upward out stroke
Pressure	26 MPa
Working cycle	60/min.
Stroke	2 mm to 10 mm
Medium	mineral oil

Sealing Arrangement for the Application at Automotiv Presses

Medium compressed air, lubricated

Application: Balancing cylinder, drawing cushion

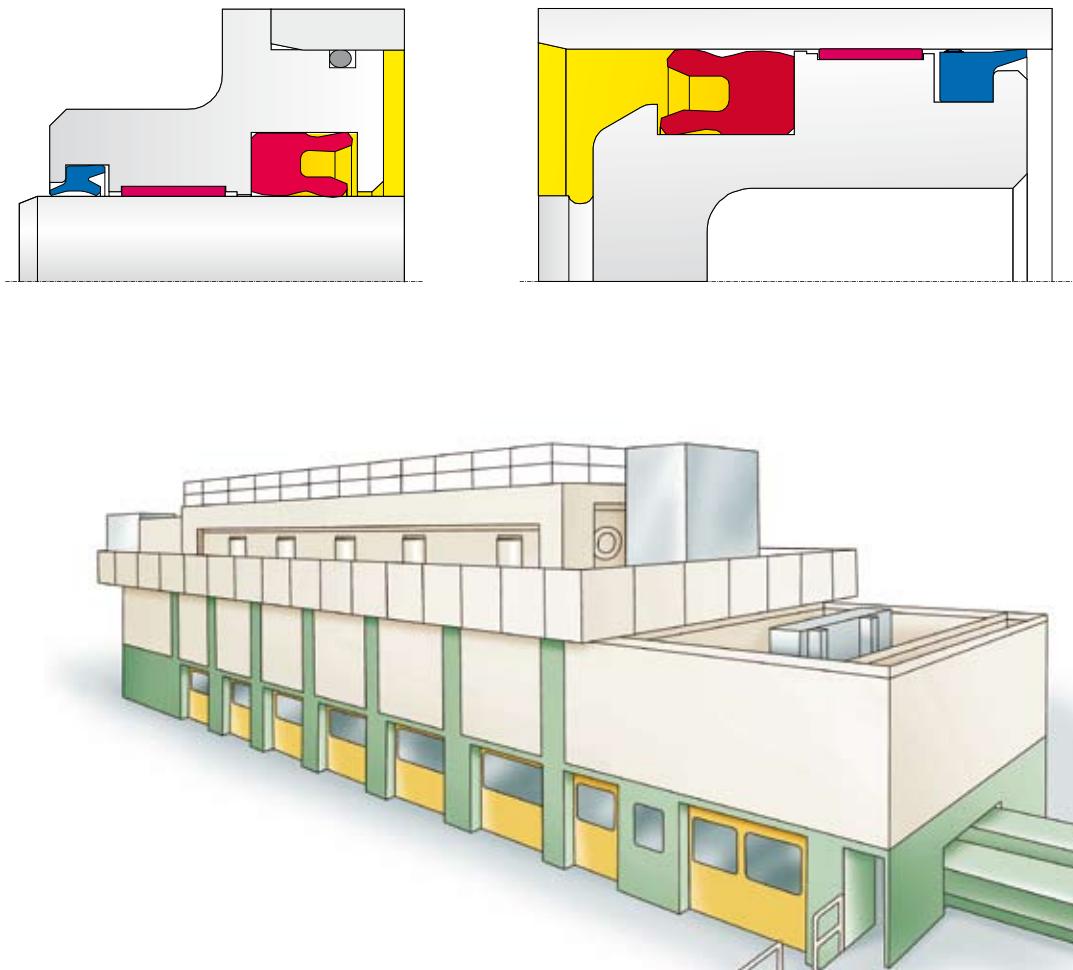

Merkel rod sealing system with double wiper PU 11, rod seal TMP 20, Guivex guide bush SBK and an O-ring.

Merkel piston sealing system with wiper PU 12, piston seal TMP 21, Guivex guide bush KBK.

Requirements for the sealing system:

- Medium compressed air, lubricated
- Robust

Typical operating parameters	
Diameter	rod: 100 mm piston: 600 mm
Movement	linear, downward out stroke
Pressure	rod: 2 MPa
Speed	1,5 m/s
Stroke	1500 mm
Medium	lubricated air, initial lubrication

Sealing Arrangement for the Application at Automotiv Presses

Medium compressed air, dry

Application: Balancing cylinder, drawing cushion

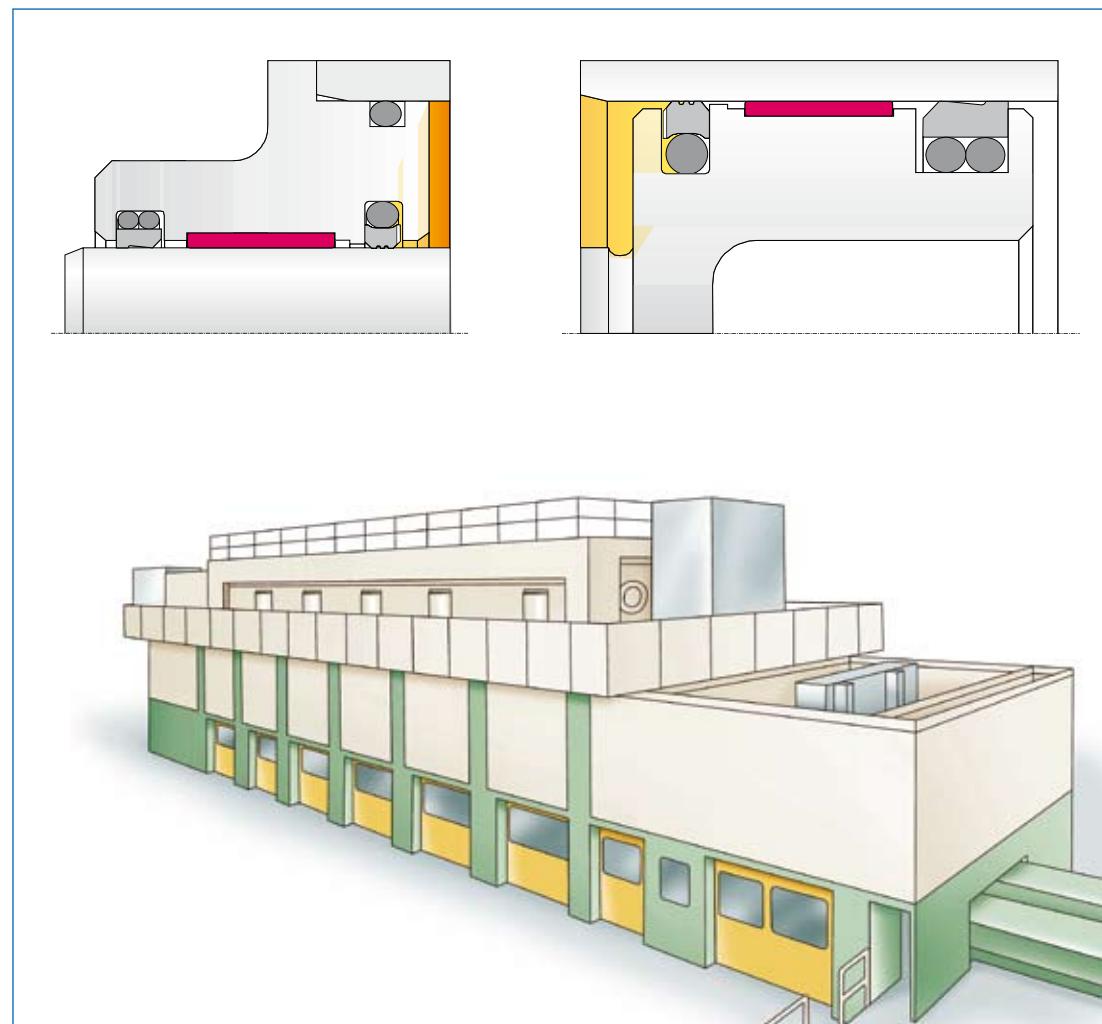

Merkel Stangen-Dichtsysteme Merkel rod sealing system with double wiper PT 1, Rotomatic M 15, Guivex guide bush SBK and an O-ring.

Merkel sealing system with Rotomatic M 16, double wiper PT 3 and Guivex guide bush KBK.

Requirements for the sealing system:

- Medium compressed air, lubricated or dry
- High speed

Typical operating parameters	
Diameter	rod: 100 mm piston: 600 mm
Movement	linear, downward out stroke
Pressure	2 MPa
Speed	2 m/s
Stroke	1500 mm
Medium	compressed air, initial lubrication, dry air

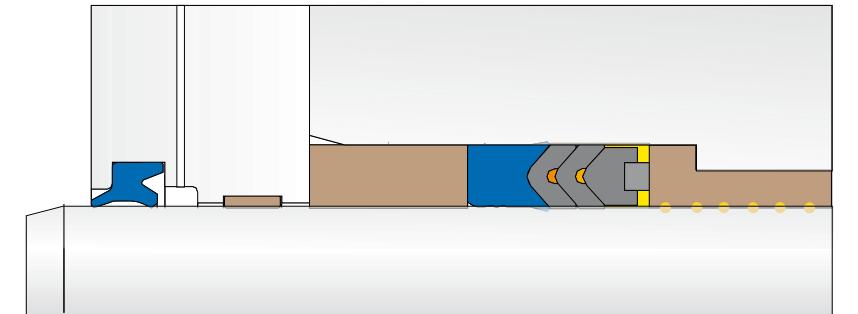

Sealing Arrangement for Existing Seal Housing

Roof-shaped seal set with polyurethane pressure ring

Merkel rod sealing system with double wiper PU 11, roof shaped seal set ES 81, PTFE bronze guide band SF.

Product advantages

- High sealing effect by means of a modern polyurethane pressure ring with optimized geometry (finite element)
- Additional static sealing edge against the ingress of air (partial vacuum)
- Favourable frictional characteristic by means of a grooved contact surface
- High resistance against gap extrusion by means of a robust polyurethane pressure ring

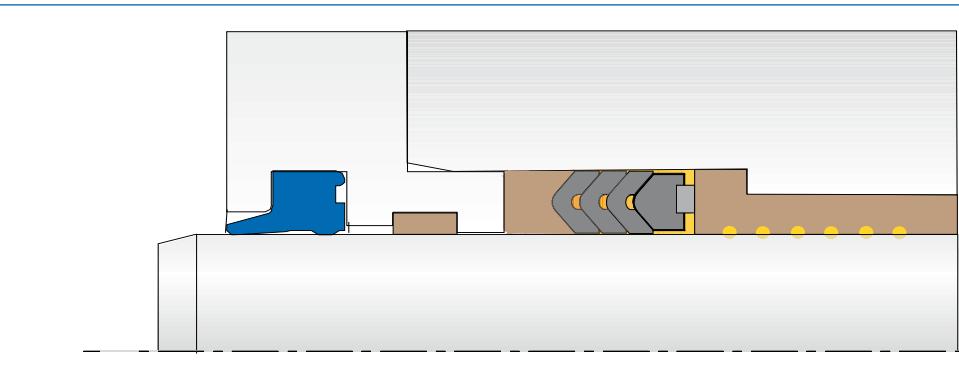

Roof-shaped seal set with PTFE bronze pressure ring

Merkel rod sealing system with wiper PU 6, roof shaped seal set ES 61, PTFE bronze guide band SF.

Product advantages

- High resistance against gap extrusion by means of a robust pressure ring made of PTFE-bronze compound
- High operating reliability by means of robust fabric roof-shaped seals
- Constant axial preload by means of a rubber spring activated support ring
- Installation in non-adjustable seal housing

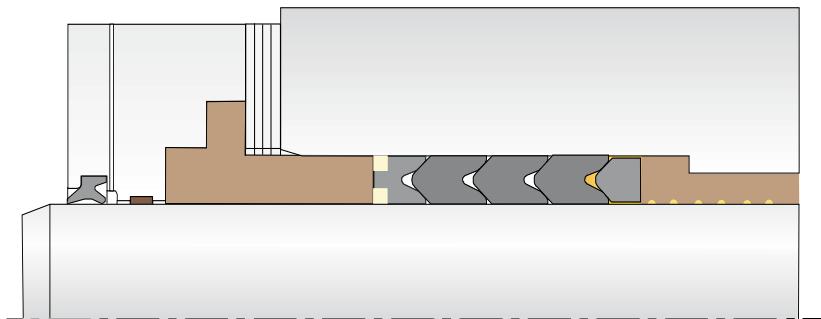

Rod-V-packing set with integrated back-up ring

Merkel rod sealing system with V-packing set with integrated back-up rings, double wiper P 9 and PTFE-bronze guide band SF.

Product advantages

- Excellent gap bridging (high pressure; increase of guidance clearance due to wear)
- Tolerant to misalignment of shaft
- Insensitive to poor surface quality (rough environment)
- Special design of profile for an excellent adjustability

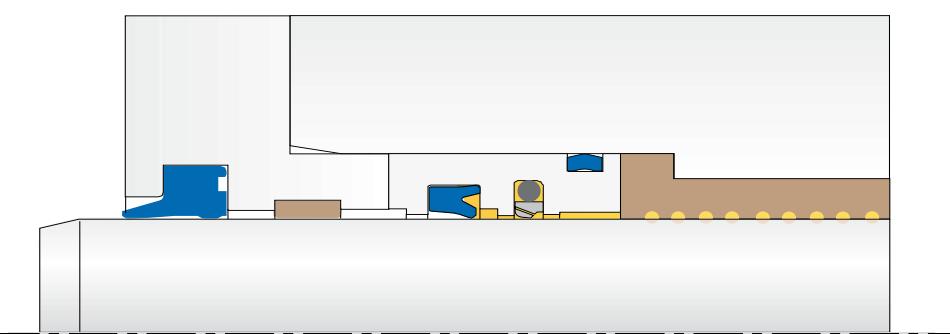

Cartridge sealing systems

Profile Roof-shaped seal set ≥ 15 mm

Merkel rod sealing system with wiper PU 6, guide band SF and the cartridge with U-ring T 20, Omegat OMS-MR PR, Cover Seal PU 83

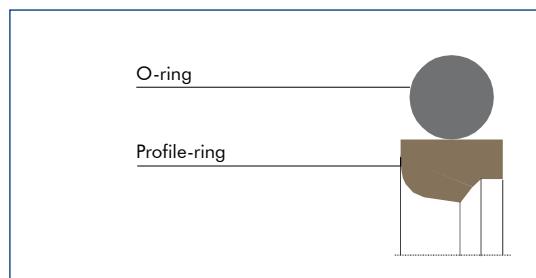

Product advantages

- High sealing effect
- Favourable frictional characteristic (control precision; short cycle time; high speed)
- Constant long-term behaviour (no load compression)
- Simple assembly

Merkel Rod Seal Omegat OMS-MR

Material

O-ring

Material	Designation
Nitrile rubber	NBR
Fluoroelastomer	FKM

Other material combinations available on request.

Operating conditions

Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	5 m/s

Product description

Two-piece seal set for sealing piston rods, consisting of a PTFE profile ring and an O-ring as a preloading element.. .

Product advantages

Rod seal especially suitable for use within a sealing system.

- Very high stability under pressure
- Good thermal conductivity
- Very good extrusion safety
- High resistance to abrasion
- Low friction, stick-slip free

Material

PTFE profile ring

Material	Designation	Color

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Material content $Mr > 50\%$ to max. 90 %, with cut depth $c = R_z/2$ and reference line $Cref = 0\%$

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface.

A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.

See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance and the deflection of the guide under load.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension		Max. permissible gap dimension			
L	Profile	16 MPa	26 MPa	32 MPa	40 MPa
3,2	3,65	0,4	0,35	–	–
4,2	5,35	0,5	0,4	0,3	–
6,3	7,55	0,55	0,45	0,35	0,3
8,1	10,25	0,6	0,5	0,4	0,4
8,1	12	0,7	0,6	0,55	0,5
9,5	13,65	0,75	0,65	0,6	0,55

At an operating temperature of above 90°C, and simultaneous exposure to an operating pressure of more than 26 MPa, we recommend the use of the material compound PTFE B602 and PTFE C104.

Tolerances

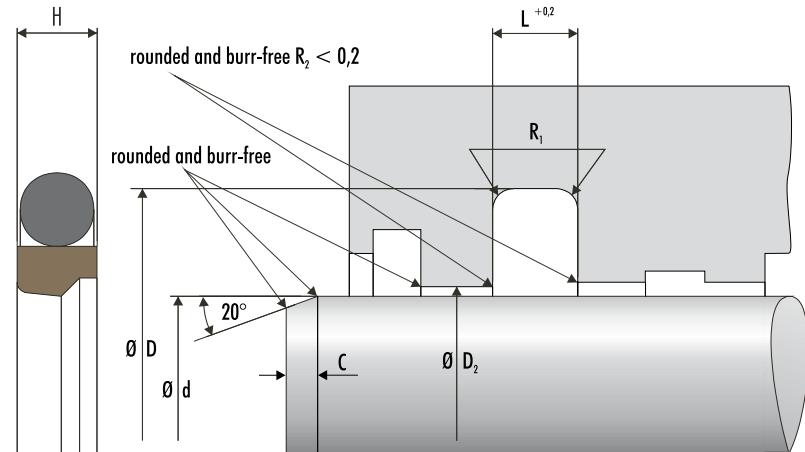

Diameter D	Tolerance
< 500	H8
> 500	H7

The tolerance for the diameter d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Installation & assembly

Flawless functioning of the seals is conditional on meticulous installation.

Other material combinations and further dimensions are available on request.

The technical drawing illustrates a rod seal assembly. Key dimensions include: height H, outer diameter D, inner diameter d, shoulder width C, and rod length L. The seal profile is shown with rounded and burr-free edges. Material properties listed are PTFE GM201 / NBR, PTFE B602 / NBR, or PTFE C104 / NBR.

Other material combinations and further dimensions are available on request.

The technical drawing illustrates a rod seal assembly. On the left, a vertical cross-section shows a cylindrical rod with diameter d being sealed into a housing with inner diameter D . The seal has a height H and a shoulder length L . On the right, a horizontal cross-section shows the seal's profile with a shoulder radius R_1 and a shoulder length $L^{+0,2}$. The seal's shoulder has a 20° taper angle. Key dimensions include $\varnothing D$, $\varnothing d$, and C . The text "rounded and burr-free" appears twice, indicating surface finish requirements.

Merkel Rod Seal OMS-MR PR

Product description

Two-piece seal set for sealing piston rods, consisting of a PTFE profile ring with an integrated pressure relief function, plus an O-ring as a preloading element. Patented product design.
(Patent No.: DE 10117662 Cl)

Product advantages

- interchangeable with housings of the OMS-MR series
- enhanced operating reliability of sealing systems with tough operating parameters (no continuous pressure build-up in the intermediate space)
- extended service life of sealing systems due to stable long term behavior (reduced loads on the sealing system from friction and wear)

Material

PTFE profile ring

Material	Designation	Color
PTFE-bronze compound	PTFE B602	brown
PTFE-glass-fiber-MoS ₂ compound	PTFE GM201	light grey

O-ring

Material	Designation
Nitrile rubber	NBR
Fluoroelastomere	FKM

Other material combinations available on request.

Applications

- Primary seal in a sealing system
- Long stroke (greater than 400 mm)
- High running speed when the piston rod is extended (greater than 0.5 m/s)
- Sizeable velocity differences in dependence on the direction of motion (v_{ext} greater than $8 \times v_{retr}$)
- Fast pressure drop in the main chamber

Operating condition

Material	PTFE B602/NBR

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface.

Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{xk}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance and the deflection of the guide under load.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material.

See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension					
	L	Profile	16 MPa	26 MPa	32 MPa	40 MPa
4,2	5,35	0,5	0,4	0,3	-	
6,3	7,55	0,55	0,45	0,35	0,3	
8,1	10,25	0,6	0,5	0,4	0,4	
8,1	12	0,7	0,6	0,55	0,5	
9,5	13,65	0,75	0,65	0,6	0,55	

At an operating temperature of above 90°C, and simultaneous exposure to an operating pressure of more than 26 MPa, we recommend the use of the material compound PTFE B602 and PTFE C104.

Tolerances

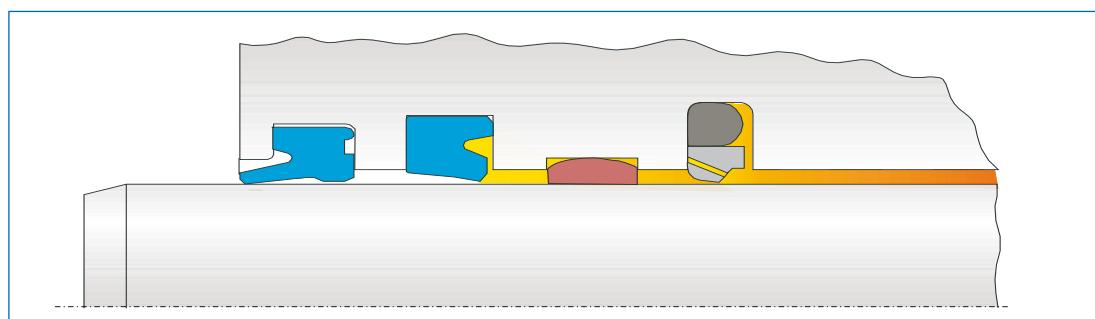

Diameter D	Tolerance
< 500	H8
> 500	H7

The tolerance for the diameter d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

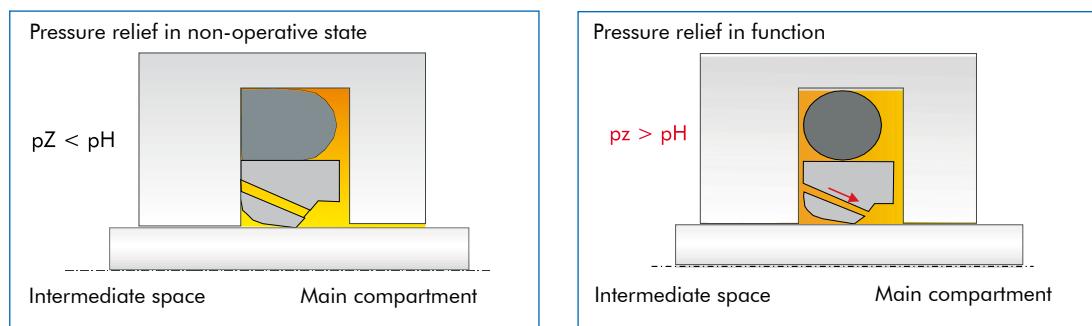

Installation & assembly

Reliable seal function is dependent on correct installation.
See also *Merkel Technical Manual*.

Functional principle

The Omegat OMS-MR PR features an integrated pressure relief function. As soon as the pressure in the intermediate space p_z becomes greater than the main-compartment pressure p_H (caused, for example, by unfavorable velocity conditions during extension and retraction), the seal can be relied on to relieve the pressure. The sealing function of the Omegat OMS-MR PR corresponds to that of the field-proven Omegat seals.

p_Z = pressure in the intermediate space; p_H = pressure in main compartment

Additional product description for Omegat OMS-MR PR

Intermediate-space pressure

In operation, the space between the primary and secondary seals is filled with hydraulic medium after a few cycles. The further entry of media leads to an increase of the pressure in the intermediate space. If a U-packing is used as the secondary seal, then it will act as a volume compensator under pressure by reason of the mold-release volume, thus contributing towards reducing the general pressure level. Normally, the pressure in the intermediate space will settle at up to 5 MPa, in dependence on the operating parameters, and is then reduced again with a temporal offset to the main compartment's pressure during the return stroke.

Pressure build-up

In the case of a large stroke length (> 400 mm), and a high running speed (> 0.5 m/s) while the rod is being extended, but also as a consequence of vibrations and in the case of major differences in velocity in dependence on the direction of motion (v_{refr} greater than $8 \times v_{ext}$), a comparatively larger volume of oil is released into the intermediate space under the sealing edge than comes out of it. If these or similar operating parameters apply, a significantly increased pressure level will be formed in the intermediate space. The higher pressure is reduced incompletely during the return stroke, and can be accumulated over a number of cycles. The pressure level can here rise continuously until it exceeds the operating pressure. The increased pressure in the intermediate space results in an increased amount of friction.

The temperature rises, and thus not only fosters deformation of the PTFE Profile ring of the primary seal under load, but also reduces the extrusion resistance of the secondary seal. Because of the increased friction, moreover, intensified wear can be expected, and due to the frictional heat produced, accelerated aging of the hydraulic medium can also be anticipated.

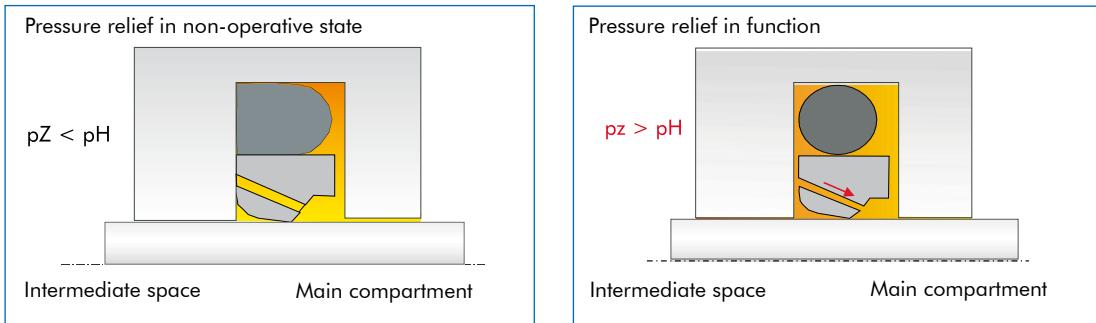

If, as a result of the above-mentioned phenomena, the pressure in the intermediate space is significantly higher than in the main compartment, then the preloading element of the primary seal (O-ring) will be pushed towards the main compartment. The PTFE Profile ring of the primary seal is thereby twisted over the neutral position towards the main compartment; this movement causes the sealing edge to become gradually more rounded, and the sealing function of the primary seal is disturbed.

As this goes on, the Profile ring may tilt completely to the main compartment, which will ultimately lead to extrusion of the primary and secondary seals, and thus to the system's failure. Leakage will only become visible outside the sealing system, when the secondary seal is no longer performing its function.

Pressure relief

Building successfully on the field-proven functionality of the Omegat series, the Omegat OMS-MR PR possesses a pressure-relief feature integrated into the Profile ring. As soon as the pressure in the intermediate space is greater than in the main compartment, the pressure-relief bore is opened, and can be relied on to relieve the pressure in the intermediate space down to the pressure in the main compartment. A lasting inclusion of overpressure in the intermediate space is not possible here.

In operation, the pressure in the main compartment is higher than in the intermediate space. The pressure-relief bore is closed in contact between the PTFE Profile ring and the wall of the compartment (Fig. 01). If the pressure in the intermediate space rises to a level above that in the main compartment, then the contact between the PTFE Profile ring and the wall is broken (Fig. 02). Since the pressure is equalized directly via the pressure-relief bore, the preloading element remains on the side facing the intermediate space. The Profile ring will not tilt towards the main compartment. With the

pZ = pressure in the intermediate space; pH = pressure in main compartment

Fig.01

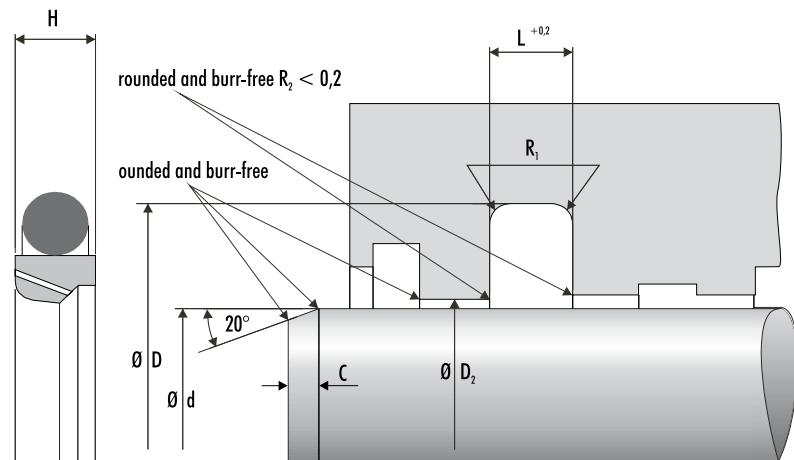

Fig.02

patented pressure-relief feature, the pressure in the intermediate space is held independently of the operating conditions at a level favorable for continuous operation. By virtue of the low thermal and mechanical stress on the sealing elements, a stable long term behavior is achieved, and the sealing system's service life is extended.

The functionality of the pressure-relief feature renders the sealing system tolerant to the external influences acting on it during operation. Operating reliability is thus enhanced across the board by using the Omegat OMS-MR PR.

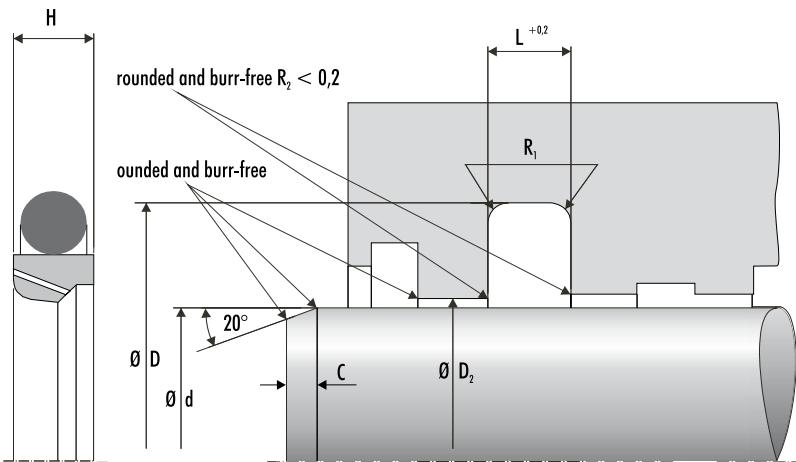

Using the Omegat OMS-MR PR makes an important contribution towards the reliability and long lifetimes of hydraulic cylinders.

Using the Omegat OMS-MR PR will eliminate downtimes caused by intermediate-space pressure, thus substantially reducing your complaint-related costs and cutting the amount of maintenance required by up to 30 %.

Merkel Rod Seal Omegat OMS-S

Product description

Two-piece seal set for sealing piston rods, consisting of a PTFE profile ring and an elastomer Profile ring as a pre-stress element. The seal set is intended for demanding hydraulic applications

Product advantages

- Very high stability under pressure
- High torsional safety
- Very good extrusion safety
- High resistance to abrasion
- Low friction, stick-slip free
- High contact pressure due to the elastomer Profile ring

Material

PTFE profile ring

Material	Designation	Color
PTFE-glass-fiber-MoS2 compound	PTFE GM201	light grey

Elastomer profile ring

Material	Designation	Hardness
Nitrile rubber	NBR	80 Shore A

Other material combinations available on request.

Application

- Especially designed for heavy-duty applications
- Especially designed for large dimensions
- Seal set for tough applications
- Seal set suitable for large gaps

Operating conditions

Material	PTFE GM201/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface.

A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance and the deflection of the guide under load.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension		Max. permissible gap dimension			
L	Profile	16 MPa	26 MPa	32 MPa	40 MPa
12,5	12,5	0,75	0,65	0,55	0,5
15	15	0,75	0,65	0,55	0,5
17,5	17,5	0,75	0,65	0,55	0,5
20	20	0,8	0,7	0,6	0,55

Tolerances

Diameter D	Tolerance
< 500	H8
> 500	H7

The tolerance for the diameter d and D2 is specified in connection with the gap dimension calculation.
In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

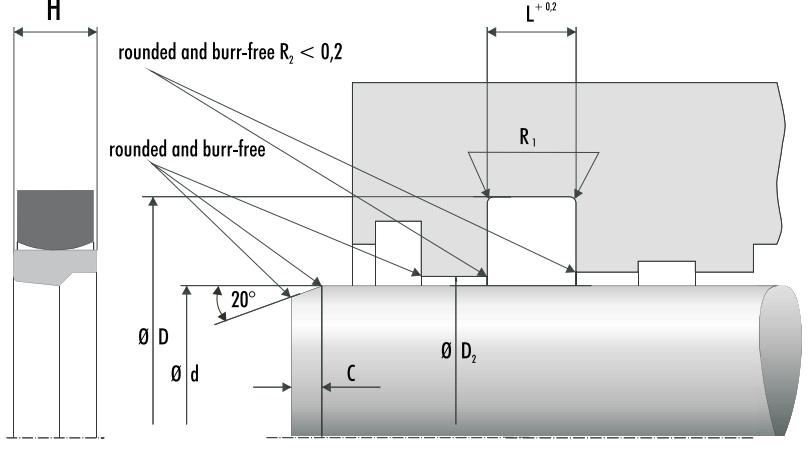

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

When fitting the Omegat OMS-S the elastomer profile ring is first placed in the housing groove, then the Profile ring is deformed to a kidney shape and sprung into place.

During this process it is to be ensured no sharp kinks are produced in the PTFE profile ring and that the sealing edge is correctly arranged in relation to the direction of the pressure. The entire fitting operation is only allowed to be performed over rounded edges.

The technical drawing illustrates a rod seal assembly. It features a cylindrical rod with a diameter $\varnothing D_2$. A shoulder on the rod has a radius R_1 and a length $L^{+0.2}$. A stepped profile is machined into the rod, with a shoulder height of C . The profile has a shoulder radius $R_2 < 0.2$ and a shoulder angle of 20° . The total height of the seal is H , and the inner diameter of the seal body is $\varnothing d$.

Merkel Rod Seal OMS-S PR

Applications

- Primary seal in a sealing system
- Long stroke (greater than 400 mm)
- High running speed when the piston rod is extended (greater than 0.5 m/s)
- Sizeable velocity differences in dependence on the direction of motion (vext greater than 8x vretr)
- Fast pressure drop in the main compartment
- Large diameters (greater than 200 mm)

Product description

Two-piece seal set for sealing piston rods, consisting of a PTFE profile ring with an integrated pressure-relief function, a support runner and an elastomer profile ring as the preloading element (Patent No.: DE 10117662 Cl)

Product advantages

- Interchangeable with housings of the OMS-S series
- Enhanced operating reliability of sealing systems with tough operating parameters (no continuous pressure build-up in the intermediate space)
- Extended service life of sealing systems due to stable long term behavior (improved stability against twisting due to the support runner)
- High resistance to extrusion (large deformation volume of the PTFE profile ring)

Material

PTFE profile ring

Material	Designation	Color
PTFE-Bronze-Compound	PTFE B602	brown
PTFE-glass-fiber-MoS ₂ compound	PTFE GM201	light grey
PTFE-carbon-fiber-Compound	PTFE C104	dark grey

Elastomer profile ring

Material	Designation
Nitrile rubber	NBR
Fluoroelastomere	FKM

Other material combinations are available on request.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_kx}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{kx}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterparts. See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension				
	L	Profile	16 MPa	26 MPa	32 MPa
12,5	12,5	0,75	0,65	0,55	0,5
15	15	0,75	0,65	0,55	0,5
17,5	17,5	0,75	0,65	0,55	0,5
20	20	0,8	0,7	0,6	0,55

At an operating temperature of above 90°C, and simultaneous exposure to an operating pressure of more than 26 MPa, we recommend the use of the material compounds PTFE B602 and PTFE C104.

Tolerances

Diameter D	Tolerance
≤ 500	H8
> 500	H7

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

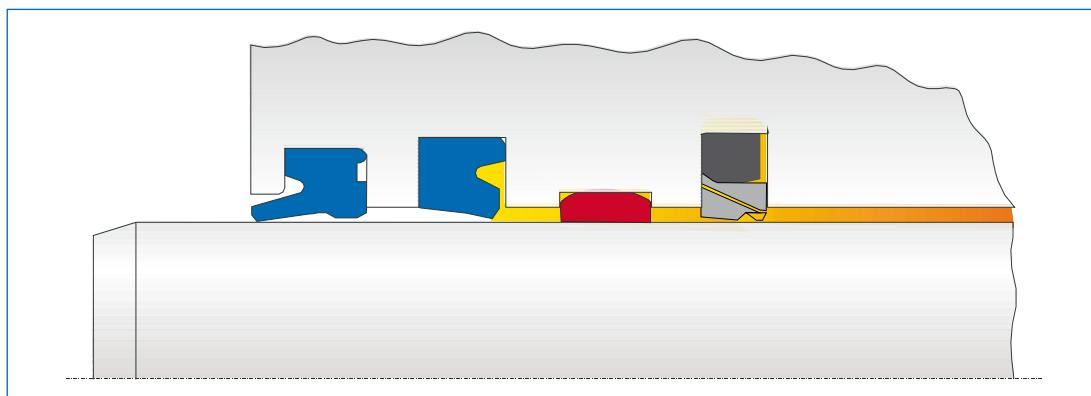

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

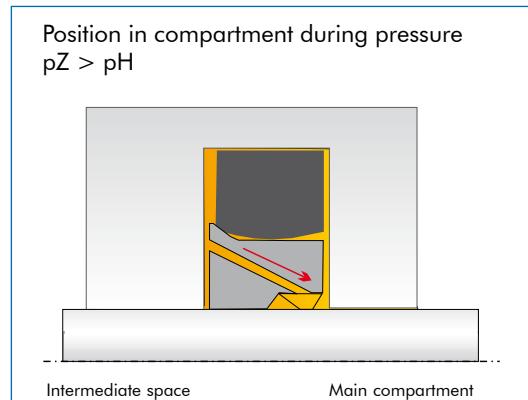

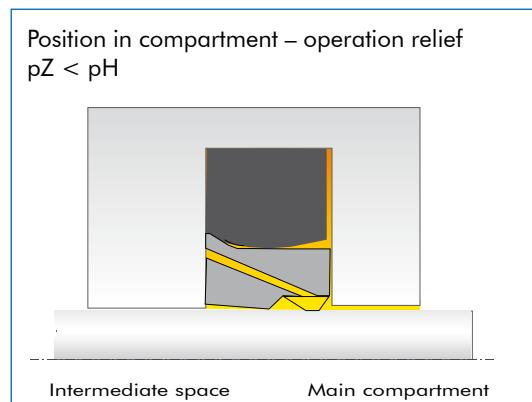

Installation & assembly

Reliable seal function is dependent on correct installation. See also *Merkel Technical Manual*
See also *Merkel Technical Manual*.

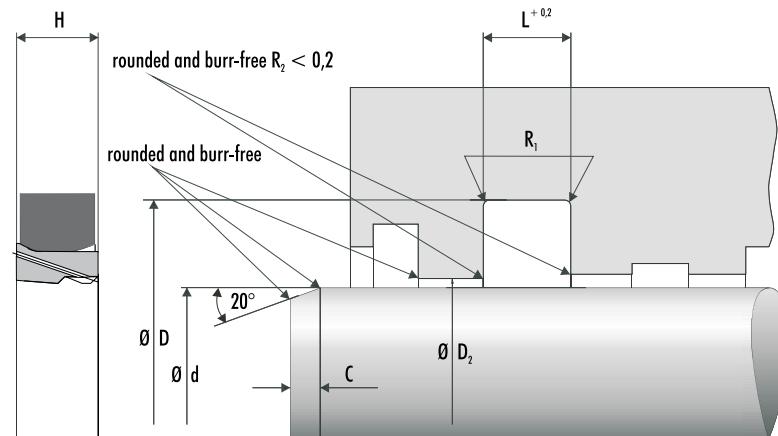

Functional principle

The Omegat OMS-S PR features an integrated pressure relief function. As soon as the pressure in the intermediate space p_Z becomes greater than the main-compartment pressure p_H (caused, for example, by unfavorable velocity conditions during extension and retraction), the seal can be relied on to relieve the pressure. The sealing function of the Omegat OMS-S PR corresponds to that of the field-proven Omegat seals.

p_Z = pressure in the intermediate space; p_H = pressure in main compartment

Merkel Rod Seal U-Ring T 20

Product description

U-ring with asymmetrical profile for sealing piston rods.

Product advantages

- Extended service life in the sealing system, due to volume compensation
- Functional reliability in the event of radial deflection due to Profile size overlap
- Operating reliability, due to sturdiness of the polyurethane profile ring
- High sealing effect, due to prominent sealing edge (high line force)
- Secured against metallic contact by high extrusion resistance (large seal gap)
- Favorable friction values at low pressures due to
- Short contact length (secondary seal)
simple and secure installation (single-piece element)

Material

Material	Designation	Color
Polyurethane	95 AU V142	dark blue
Polyurethane	94 AU 925	light blue

The material is determined by the nominal diameter and the production process involved.

Applications

- Secondary seal in a sealing system
- Single seal in the pressure range up to 26 MPa
- Single seal for subordinate applications in the pressure range up to 40 MPa
- Nominal diameter up to 2,000 mm

Field of application

Material	95 AU V142/94 AU 925
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +40 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +60 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Pressure	40 MPa
Running speed	0,5 m/s*

* When the T 20 is used as a secondary seal, running speed of up to 1.5 m/s can be permitted.

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Material content Mr > 50 % to max. 90 %, with cut depth $c = R_z/2$ and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R_a	> 0,05 μm	< 0,30 μm
R_{max}	< 2,5 μm	
R_{pkx}	< 0,5 μm	
R_{pk}	< 0,5 μm	
R_k	> 0,25 μm	< 0,7 μm
R_{vk}	> 0,2 μm	< 0,65 μm
R_{vkv}	> 0,2 μm	< 2,0 μm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces. See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension			
	16 MPa	26 MPa	32 MPa	40 MPa
≤ 5,0	0,45	0,4	0,35	-
> 5,0 ... 7,5	0,5	0,45	0,4	0,35
> 7,5 ... 12,5	0,55	0,5	0,45	0,4
> 12,5 ... 15,0	0,6	0,55	0,45	0,4

If the T 20 U-ring is used as a secondary seal in a sealing system, a larger gap dimension can be set. The general rule applying here is $D_2 = d + 1 \text{ mm}$ with a tolerance of H11 for $D_2 \leq 400$ or $+0,4$ for $D_2 > 400$.

Tolerances

Diameter D	Tolerance
≤ 400	H11
> 400	+0,4

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Design notes

For U-rings with a nominal dimension of $d < 25$ mm, an axially accessible housing is required. U-rings with a nominal dimension of $d > 25$ can generally be installed in a recessed groove using a fitting tool or by hand. Depending on the ratio of the nominal diameter to the Profile dimension, in individual cases an axially accessible housing will be required here as well (note in the article list).

Housing recommendation for larger diameters (individual seal)

d	D	L	C
$> 320 \dots 600$	$d + 30$	25	11
$> 320 \dots 720$	$d + 40$	32	12
$> 720 \dots 2000$	$d + 50$	40	16

Housing recommendation for larger diameters (secondary seal in a sealing system)

d	D	L	C
$> 320 \dots 600$	$d + 20$	16	8
$> 600 \dots 950$	$d + 25$	20	10
$> 950 \dots 2000$	$d + 30$	25	11

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

*Reliable seal function is dependent on correct installation
See also *Merkel Technical Manual*.*

Additional product description for U-ring T 20

secondary seal, then it will act as a volume compensator under pressure by reason of the mold-release volume (Fig. 01). The pressure level in the intermediate space, and thus the thermal and mechanical loads as well, are effectively reduced.

Fig. 01
Merkel U-ring T 20 at 0 MPa Merkel U-ring T 20 at 20 MPa

Seal configuration

The choice of a sealing element is crucially influenced by the material-dependent resistance to extrusion and the likewise material-dependent friction and wear behaviors.

The values of the principal characteristics (sealing effect, dimensional stability and friction or wear) are mutually contradictory in this context. Depending on the operating and boundary conditions involved, U-rings made of Polyurethane are used as individual seals, but more frequently in an appropriate combination of individual sealing and guide elements as a secondary seal in a sealing system.

The characteristics of the individual elements in a sealing system are optimized in line with the principal requirement involved. An individual seal, or the primary seal in the system concerned, is exposed to the operating pressure. The principal requirement being high resistance to extrusion coupled with favorable frictional values under high pressure. The secondary seal in a sealing system is exposed to the low intermediate space pressure. The principal requirements in this case are the effective reduction of the residual-oil film released via the primary seal, coupled with favorable frictional values at low pressures.

Mold-release volume

In a sealing system, the space between the primary and secondary seals is filled with hydraulic medium after a few cycles. The further entry of media leads to an increase of the pressure in the intermediate space. If a U-ring is used as the

Sealing effect

An element's sealing effect is described in terms of the ratio between the wiping effect and the return capability.

The initial sealing effect of compact, two-piece sealing elements is achieved by pressing the pre-stressing element. There is thus, of course, a close interdependence between the deformation of the loading element and the force being applied. A small change in the compression (due to tolerances and radial movement) results in a relevant change in the force being applied and thus ultimately in the sealing effect. In the case of the T 20 U-ring, the initial sealing effect is entailed by the deformation of the sealing lips. Small changes in the radial contact pressure do not produce any relevant change in the pressure exerted by the sealing edge. The U-ring's geometry is thus, at a consistently high level of functionality, tolerant to radial deflections.

In the high-pressure range, many sealing elements exhibit a satisfactory sealing effect, attributable solely to the high contact pressure on the counterface. In the pressure range up to 5 MPa (intermediate space pressure in the sealing system), by contrast, the sealing effect is crucially influenced by the edge geometry and the contact stress. The compression characteristic under the sealing edge is generally optimized so as to ensure effective wiping ability in the pressure chamber (rapid pressure rise) and a good return capability

In comparison to compact sealing elements, the U-ring geometry of the T 20 exhibits a short contact length at low pressure, with a definite pressing maximum value. The oil film is effectively downsized here, all that remains is the wetting on the counterface, desirable in terms of the sliding characteristics.

Friction

With sealing elements made of polyurethane, the material properties mean that a high sealing effect is achieved. Depending on the force being applied and the size of the contact area, the seal material is intermeshed to a greater or lesser extent with the counterface. The closer the contact, the higher the friction force will be. Due to the small contact length of a PU U-ring in the low-pressure range, significantly lower friction values are achieved in comparison to compact sealing elements made of polyurethane.

As the secondary seal in a sealing system, the T 20 U-ring is subjected to significantly less than the mold-release pressure. If, however, the U-ring is being used as an individual seal, the operating pressure may rise to a level above the U-ring's mold-release pressure. Because of the increased intermeshing between the seal material and the counter surface due to the enlarged contact area, the amount of friction rises. If the working pressure is between 5 MPa and 10 MPa, the friction-optimized version LF 300 (LF = "low friction") with a grooved contact surface is the preferable option.

Extrusion

The resistance to extrusion is essentially determined by the properties of the seal materials. In addition, not only the size of the deformation, but the deformation volume available also plays a crucial role. Due to the generally larger volume provided by a U-ring, larger gaps can be permitted here under otherwise identical boundary conditions in comparison to a compact seal with a slip ring made of Polyurethane. This significantly reduces the possibility of unwanted metallic contacts.

The sealing system's service life is extended by using the T 20 U-ring in the sealing system concerned, since as a volume compensator it substantially reduces the thermal and mechanical stresses involved, thus assuring stable long term behavior.

Due to a U-ring's larger deformation volume, larger gaps can be permitted, thus significantly reducing the possibility of metallic contacts.

The T 20 U-ring exhibits an edge geometry designed for optimum sealing effect. Individual seals and sealing systems with a T 20 U-ring as the secondary seal score highly in terms of a very good sealing effect.

Merkel Rod Seal U-Ring TM 20

Product description

U-ring with asymmetrical profile for sealing piston rods.

Product advantages

- Low breakaway force
- Good media resistance
- Wide operating temperature range
- Very good static and dynamic tightness
- Dynamic return capability
- Use as an individual seal or as a secondary seal in sealing systems possible
- Large range of dimensions
- No moulding tools

Material

Material	Designation	Color
Polyurethane	95 AU V142	dark blue
Polyurethane	94 AU 925	light blue

The material is determined by the nominal diameter and the production process involved.

Applications

- Secondary seal in a sealing system
- Single seal in the pressure range up to 26 MPa
- Single seal for subordinate applications in the pressure range up to 40 MPa
- Nominal diameter up to 2,000 mm

Operating conditions

Material	95 AU V142/94 AU 925
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +40 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +60 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Pressure	40 MPa
Running speed	0,5 m/s*

* When the TM 20 is used as a secondary seal, running speed of up to 1.5 m/s can be permitted.

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces. See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension			
Profile	16 MPa	26 MPa	32 MPa	40 MPa
> 7,5 ... 12,5	0,55	0,5	0,45	0,4
> 12,5 ... 15,0	0,6	0,55	0,45	0,4
> 15,0 ... 20,0	0,65	0,6	0,5	0,45
> 20,0 ... 25,0	0,65	0,6	0,5	0,45

If the T 20 U-ring is used as a secondary seal in a sealing system, a larger gap dimension can be set. The general rule applying here is $D_2 = d + 1$ mm with a tolerance of H11 for $D_2 \leq 400$ or $+0,4$ for $D_2 > 400$.

Housing recommendations for new equipment

TM 20 Primary seal

d	D	L	C
>320 ... 600	d + 30	25	11

>650 ... 950	d + 25	20	10
>950 ... 2000	d + 30	25	11

Fitting & installation

Rod seals can be sprung into grooves by hand or with a fitting tool.

For different housings, e.g. in old plant, please consult our advisory service.

Merkel U-Ring TMP 20

Operating conditions

Material	93 AU V167/93 AU V168
Pneumatic: air, dry or lubricated	-10 ... +80 °C
Pressure	2 MPa*
Running speed	1,5 m/s

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Percentage contact area Mr >50% up to max. 90% at cutting depth c = RZ/2 and reference line C ref = 0%. Abrasive surfaces, scores, scratches and blowholes are to be avoided.

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

Housing recommendations for new design

d	D	L	C
>50 ... 200	d + 20	16	8,5
>100 ... 320	d + 25	20	10
>150 ... 630	d + 30	24	11,5
>400 ... 800	d + 40	32	12,5
>800 ... 1200	d + 50	40	16
>1000 ... 2000	d + 60	48	18

Application

Rod seal for heavy pneumatic loads and high operating requirements.

Material

Material	Designation	Color
Polyurethane	93 AU V167	red
Polyurethane	93 AU V168	rot

The material is determined by the diameter.

Tolerances

Diameter D	Tolerance
< 250	H10
>250	H11

Installation & assembly

The rod seals can be snapped into plunge-cut grooves by hand or with a fitting tool. Please contact our application consultants about different housings, e. g. in old plants.

To achieve optimum running-in and operation behaviour, the U-rings should be oiled or greased slightly prior to use (initial lubrication).

rounded and burr-free $R_2 < 0,2$

Merkel Elastomer U-Ring L 20

Product description

Merkel elastomer U-ring with asymmetrical profile for sealing piston rods.

Product advantages

- adapted for operating medium water or water-emulsion

Material

Material	Designation	Color
Nitrile rubber	85 NBR B247	black

Application

- Suitable as a secondary seal within a sealing system
- Nominal-diameter up to 1000 mm

Operating conditions

Material	85 NBR B247
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +110 °C
Pressure	16 MPa
Running speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{kx}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces. See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension		
	5 MPa	10 MPa	16 MPa
10	0,8	0,55	0,2
12,5	0,85	0,6	0,25
15	0,95	0,65	0,3

Tolerances

Diameter D	Tolerance
< 400	H11
> 400	+0,4

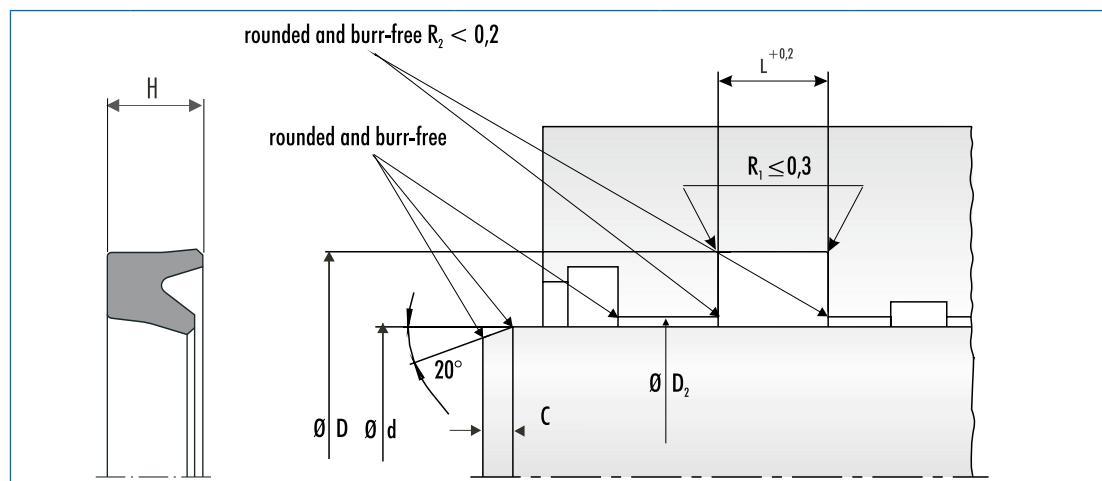

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

Please note our general remarks on hydraulic seal assembly in the *Merkel Technical Manual*.

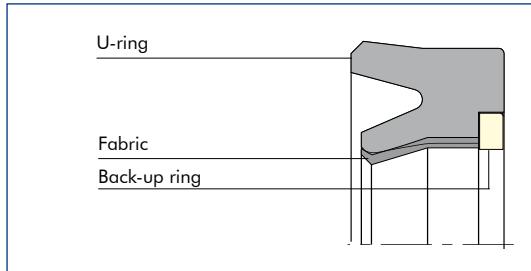

The technical drawing illustrates a rod seal assembly. On the left, a vertical profile shows a stepped seal body with a height H . On the right, a horizontal cross-section shows the seal's internal structure. Key dimensions include: $\emptyset D$ (outer diameter), $\emptyset d$ (inner diameter), C (width of the shoulder), $\emptyset D_2$ (diameter of the shoulder), L (total length), and $L^{+0,2}$ (length of the shoulder). Surface finish requirements are indicated as "rounded and burr-free $R_2 < 0,2$ " for the top surface and "rounded and burr-free" for the shoulder area. A note specifies $R_1 \leq 0,3$. An angle of 20° is shown between the shoulder and the main body.

Merkel U-ring Seal Set 0214

Product description

Two-piece seal set comprising an elastomer U-ring with an elastomer sealing edge, fabric reinforcement on the running surface and an active back-up ring.

Product advantages

- Low friction due to fabric reinforcement
- Large dimension range
- Resistant to extrusion owing to activated back-up ring
- Low return capability (not suitable for sealing systems)
- Easy to install in non-axial housings from 100 mm diameter upwards

Applications

Single-acting rod seal for use in hydraulics and pneumatics.

Material

Profile ring

Material	Description	Color
Nitrile rubber	NBR	black
Cotton fabric	BI-NBR	black

Back-up ring

Material	Description	Color
D<300 mm Polyacetal	POM	white
D>300 mm Polyamide	PA	white

Operating conditions

Material	NBR/BI-NBR/POM or PA
Hydraulic oils HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rapeseed oil)	-30 ... +80 °C
HEES (synthetic esters)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure Hydraulic	25 or 40* MPa
Pressure Pneumatic	5 MPa
Sliding speed v in m/s	1,5 m/s

*max. pressure depends on the profile

The figures given are maximum values and must not be applied simultaneously.

With U-ring 0214 the max. pressure should only be exploited in the last section (closing pressure) if long strokes are executed; during the stroke max. 16 MPa.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

Design notes

Please note our general design remarks in the *Merkel Technical Manual*

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension			
Profile	16 MPa	26 MPa	32 MPa	40 MPa
<15	1,2	1,0	0,65	0,5
>15	1,8	1,4	0,9	0,7

Tolerances

Diameter	Tolerance
D	H10

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Installation & assembly

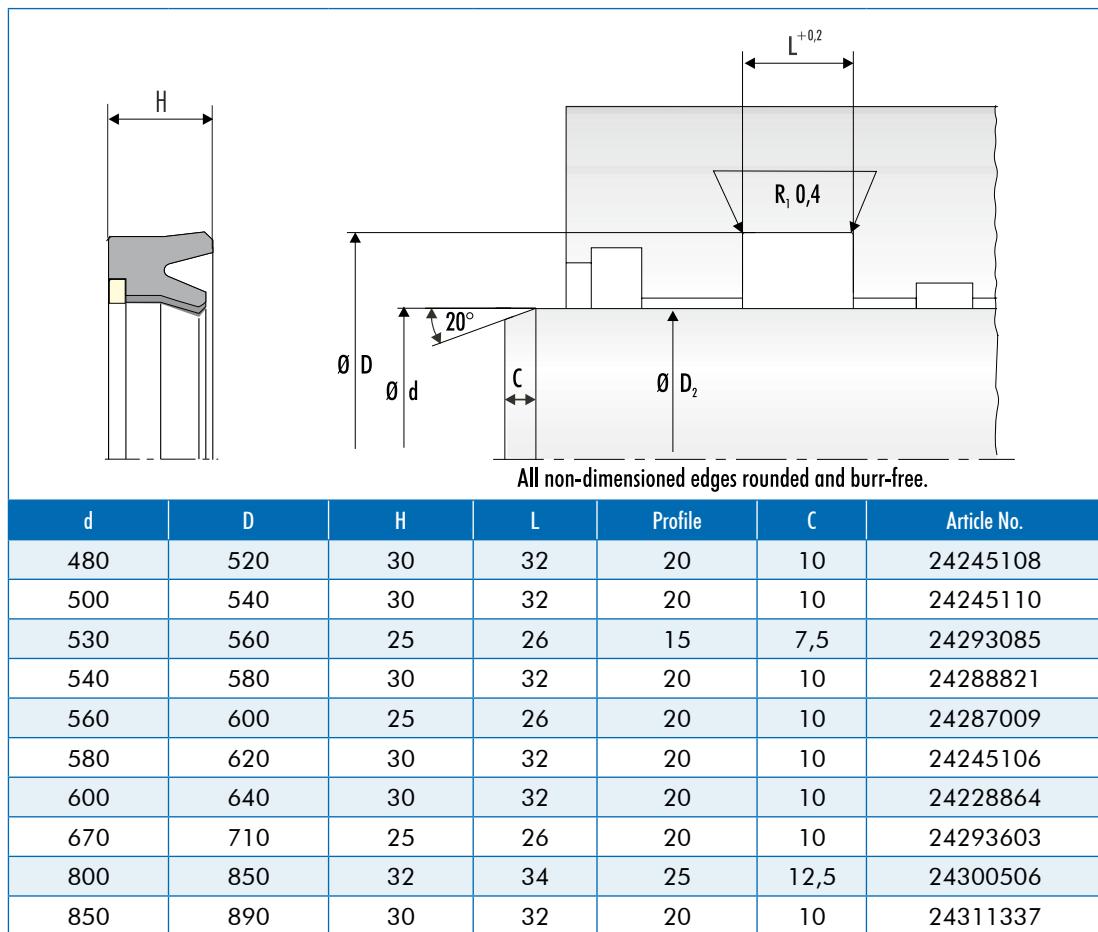

Careful assembly is a precondition for the perfect functioning of the seal. See also *Merkel Technical Manual*.

Technical drawing of an O-ring seal showing dimensions and profile. The seal has a height H , outer diameter D , inner diameter d , and a shoulder height C . The shoulder has a 20° angle and a radius $R_{1,0,4}$. The shoulder length is L with a tolerance of $+0,2$. A note at the bottom states: "All non-dimensioned edges rounded and burr-free."

Merkel U-ring Seal Set 0216

Product description

Two-piece seal set comprising an elastomer U-ring with an elastomer sealing edge, fabric reinforcement on the running surface and an active back-up ring.

Product advantages

- Low friction due to fabric reinforcement
- Large dimension range
- Resistant to extrusion owing to activated back-up ring
- Low return capability (not suitable for sealing systems)
- Easy to install in non-axial housings from 100 mm diameter upwards

Applications

Single-acting rod seal for use in hydraulics and pneumatics.

Material

Profile ring

Material	Description	Color
Nitrile rubber	NBR	black
Cotton fabric	BI-NBR	black

Back-up ring

Material	Description	Color
D<300 mm Polyacetal	POM	white
D>300 mm Polyamide	PA	white

Operating conditions

Material	NBR/BI-NBR/POM or PA
Hydraulic oils HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rapeseed oil)	-30 ... +80 °C
HEES (synthetic esters)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure Hydraulic	25 or 40* MPa
Pressure Pneumatic	5 MPa
Sliding speed v in m/s	1,5 m/s

*max. pressure depends on the Profile

The figures given are maximum values and must not be applied simultaneously.

With U-ring 0216 the max. pressure should only be exploited in the last section (closing pressure) if long strokes are executed; during the stroke max. 16 MPa.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

Design notes

Please note our general design remarks in the *Merkel Technical Manual*

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension			
Profile	16 MPa	26 MPa	32 MPa	40 MPa
<15	1,2	1,0	0,65	0,5
>15	1,8	1,4	0,9	0,7

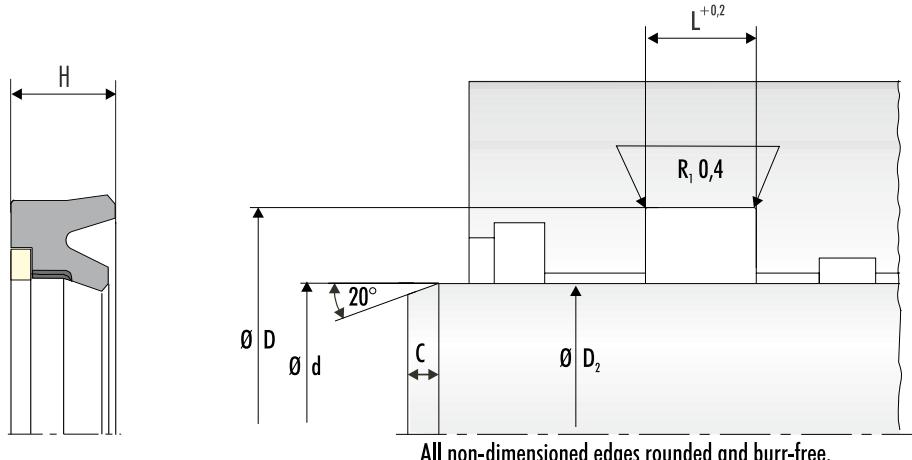

Tolerances

Diameter	Tolerance
D	H10

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

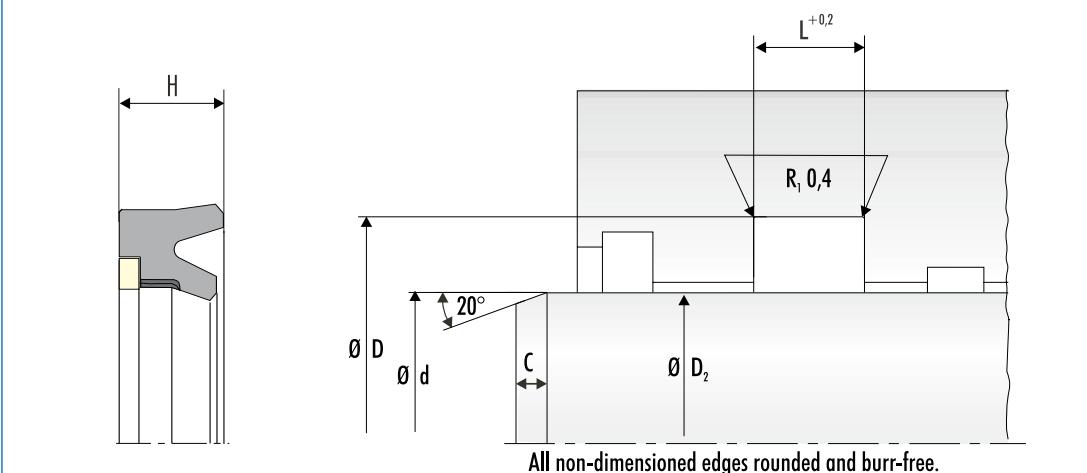

Installation & assembly

Careful assembly is a precondition for the perfect functioning of the seal. See also *Merkel Technical Manual*.

Further dimensions are available on request.

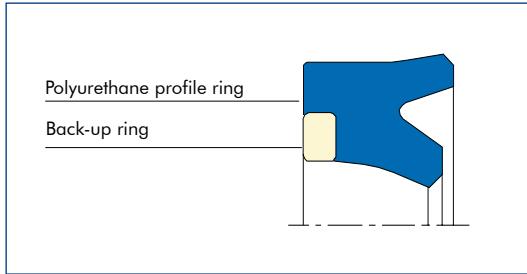

The technical drawing illustrates the cross-section and top view of a rod seal. The cross-section shows a central profile with a height H , a shoulder diameter $\emptyset D$, a shoulder thickness $\emptyset d$, and a shoulder angle of 20° . The top view shows a rectangular part with a width L and a length dimension $L^{+0,2}$ above it. A radius $R_1 0,4$ is indicated at the corner. The text "All non-dimensioned edges rounded and burr-free." is present below the top view.

Merkel U-Ring Type 0503

Product description

Two-piece Merkel seal set with asymmetrical profile, used as rod seal.

Product advantages

- Functional safety in case of radial shaft misalignment by using large Profile overlap.
- Operational safety due to robust polyurethane Profile ring.
- High sealing function due to distinctive sealing edge (high line load)
- Safety against metallic contact due to large extrusion gaps by using back-up ring for high extrusion resistance.
- Easy and secure mounting.

Applications

- Single seal for working pressures up to 50 MPa.
- Suitable for large extrusion gaps.
- Nominal diameter up to 2000 mm.

Material

Profile ring

Material	Designation	Color
Polyurethane	95 AU V142	dark blue

or

Material	Designation	Color
Polyurethane	94 AU 925	light blue

Back-up ring

Material	Designation	Color
Polyamide	PA	withe

or

Material	Designation	Color
Polyoxymethylene	POM	withe

The material is determined by the nominal diameter and the production process involved.

Operating conditions

Material	95 AU V142 94 AU 925
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +40 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +60 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Pressure	50 MPa
Running speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
Ra	> 0,05 µm	< 0,30 µm
Rmax		< 2,5 µm
Rpkx		< 0,5 µm
Rpk		< 0,5 µm
Rk	> 0,25 µm	< 0,7 µm
Rvk	> 0,2 µm	< 0,65 µm
Rvx	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces. See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension				
Profile	16 MPa	26 MPa	32 MPa	40 MPa	50 MPa
10,0 ... < 15,0	0,7	0,7	0,7	0,6	0,5
15,0 ... 30,0	1,1	1,1	1,0	0,9	0,7

Tolerances

Diameter D	Tolerance
≤ 400	H11
> 400	+0,4

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Design notes

U-Ring seal sets can be generally mounted into a pierced groove by hand. Dependent on the relation of Profile and nominal diameter, in some cases an axial accessible installation space might be necessary.

Housing recommendation for larger diameters

d	D	L	C
> 320 ... 600	d - 30	25	11
> 320 ... 720	d - 40	32	12
> 720 ... 2000	d - 50	40	16

Please note our general design remarks in the *Merkel Technical Manual*.

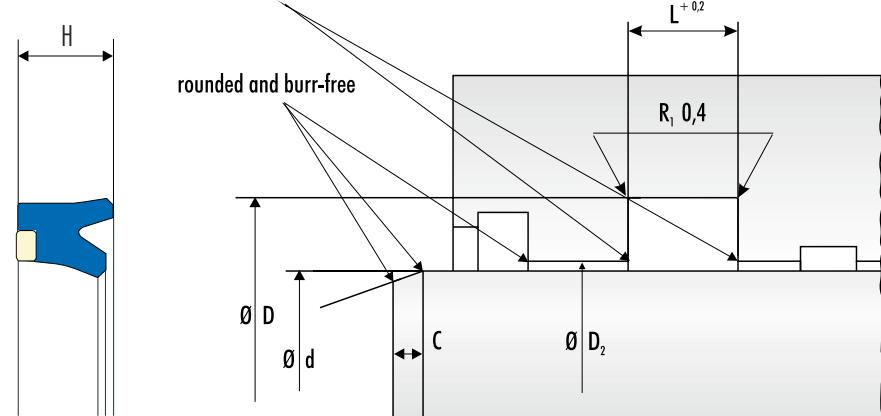

Installation & assembly

Dependent on the diameter ordered, the back-ring is delivered with a certain over-length and has to be cut to size just before mounting on site.

Precondition for a flawless function of the seal is its accurate mounting. See also *Merkel Technical Manual*.

rounded and burr-free $R_2 < 0,2$

Merkel Roof Shaped Seal Set ES/ESV

Product description

Multi-part seal set for sealing piston rods, comprising one thrust ring, at least three V-rings and one support ring. The Roof shaped seal seal sets are put together in 3 different versions.

Type A

has 3 to 5 fabric seals, and can be installed in re-adjustable and non-re-adjustable sealing spaces.

Type B

has 3 to 5 fabric seals, a rubber-mounted support ring and can be installed in non-re-adjustable installation spaces. Constant axial prestress.

Type C

has 2 to 4 fabric seals, one rubber seal and can be installed in re-adjustable and non-re-adjustable installation spaces.

For an enhanced sealing effect:

Type A and Type B can be supplied in an open version. Type C is always supplied in an endless version.

Product advantages

- field-proven under ultra-tough conditions
- long useful lifetime
- can be optimally matched to the application concerned
- functions for a certain period even on poor surfaces
- depending on the application and design involved, fluctuations in the leakage and friction behavior must be anticipated

Material

Design type	Material	Designation
ES	Cotton fabric/NBR	BI-NBR
ESV	Cotton fabric/FKM	BI-FKM

Operating conditions

Material	BI-NBR/85 NBR
Hydraulic oils HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rapeseed oil)	-30 ... +80 °C
HEES (synthetic ester)	-30 ... +80 °C
HEPG (glykol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Sliding speed	0,5 m/s

Material	BI-FKM
Hydraulic oils HL, HLP	-15 ... +140 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-15 ... +60 °C
HFD fluids	-15 ... +140 °C
Water	+5 ... +80 °C
HETG (rapeseed oil)	-15 ... +80 °C
HEES (synthetic ester)	-15 ... +100 °C
HEPG (glykol)	-15 ... +80 °C
Mineral greases	-15 ... +140 °C
Pressure	40 MPa
Sliding speed	0,5 m/s

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Profile bearing length ratio M>50% up to max. 90% with average depth c = Rz/2 and reference line Cref = 0 %

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart. A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{kx}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Gap dimension

In the case of the ES and ESV series, the gap on the side facing away from the pressure will depend on the metal guide being used, and the fit pairing. In order to avoid gap extrusion, the fits listed in the table below should be used. See also *Merkel Technical Manual*

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. (See also *Merkel Technical Manual*).

The maximum permissible extrusion gap with a one-sided position of the piston is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material.

Tolerances

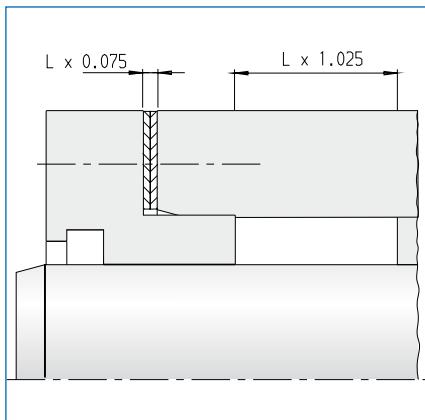

Nominal-diameter d	Tolerance
≤ 80	H9/f8
> 80 ... 120	H8/f8
> 120 ... 500	H8/f7
> 500 ... 630	H8/f7
> 630 ... 800	H8/f7
> 800 ... 1000	H8/f7
> 1000 ... 1250	H8/f7

Nominal-diameter D	Tolerance
≤ 500	H11
> 500	H10

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Housing

Re-adjustable installation spaces have the advantage of an optimal adjustment option for the sealing effect with minimal idling friction. After a lengthy period of running and incipient wear on the seal, tightening the gland can extend the useful lifetime and significantly delay a system standstill.

For re-adjustable installation spaces, an extension of 2.5 % and a re-adjustability level of 7.5 % of the „L“ dimension is recommended.

Non-re-adjustable installation spaces have the advantage of more affordable production, since shims are not required. For these installation spaces, the Type B seal set is particularly recommended. The rubber-mounted support rings handle the function of initial compression and of re-adjustment continuously during operation. There is no need for maintenance of the seal. The seal set's lifetime is optimally utilized.

Installation & assembly

Careful fitting is a prerequisite for the correct function of the seal. Before installation all individual parts of the seal set must be greased. Mineral-oil-based greases can be used so long as they have a good seal-compatibility. The rod must be in the cylinder's installation space before installation. Merkel Chevron Seal Sets can also be built-in in an open form. This has the advantage that in the event of a repair and replacement of the seal set, e.g. in a large system, it does not require a large amount of work for installation. The sealing rings are installed on the plunger or the piston rod and pushed into the housing one by one. See also *Merkel Technical Manual*.

The technical drawing illustrates three types of rod seals (Type A, Type B, and Type C) and a detailed cross-section of their installation into a housing. The rod seal profiles are shown in cross-section, with Type A having a central U-shaped cutout, Type B having a central rectangular cutout, and Type C having a central semi-circular cutout. The housing interface is shown with a shoulder of height H and a gap C. The interface is designed to be rounded and burr-free, with a 20-degree angle. The rod has a diameter D and a bore diameter d. The total length of the rod is L, and the total length including clearance is L + 0.2.

Further dimensions are available on request.

The technical drawing illustrates three types of rod seal profiles (Type A, Type B, Type C) and a detailed cross-section of a rod seal assembly. The cross-section shows a cylindrical rod with diameter $\varnothing d$, a housing with diameter $\varnothing D$, and various clearance dimensions C and L . The seal itself has a thickness H and a rounded, burr-free outer edge.

Further dimensions are available on request.

The technical drawing illustrates three types of rod seals (Type A, Type B, and Type C) and a detailed cross-section of a rod seal assembly. The cross-section shows a cylindrical rod with diameter $\varnothing d$, a housing with diameter $\varnothing D$, and various clearance dimensions C , L , and H . The cross-section also indicates 'rounded and burr-free' edges at 20° angles.

The technical drawing illustrates three types of rod seals (Type A, Type B, and Type C) and a detailed view of the housing interface. The housing interface features a shoulder with a height H , a gap C , and a length $L^{+0,2}$. The shoulder has a radius of $\varnothing D$ and a bore diameter of $\varnothing d$. The interface is described as "rounded and burr-free" and includes a 20° angle.

Further dimensions are available on request.

The technical drawing illustrates three types of rod seals (Type A, Type B, and Type C) and a detailed cross-section diagram. The cross-section shows a cylindrical housing with dimensions D, d, L, C, and a shoulder angle of 20 degrees. The shoulder height is labeled H.

Further dimensions are available on request.

The technical drawing illustrates three types of rod seals (Type A, Type B, and Type C) and a detailed view of the housing interface.

Type A: Shows a seal with a height H, featuring a central U-shaped cutout.

Type B: Shows a seal with a height H, featuring a central U-shaped cutout and a solid black base.

Type C: Shows a seal with a height H, featuring a central U-shaped cutout and a solid black base.

Detailed View: Shows the housing interface with dimensions: C (width of the housing slot), L (length of the housing slot), Ø D (outer diameter of the housing), and Ø d (inner diameter of the housing). The interface is described as "rounded and burr-free" with a 20° angle.

Merkel Roof Shaped Set Type ES 61

Product description

Multipart seal set for sealing piston rods, comprising one PTFE-bronze-compound pressure ring, rubber-fabric V-rings and one rubber energised support ring.

Product advantages

- High extrusion resistance by using robust PTFE-bronze-compound pressure ring
- High operational safety by using robust rubber-fabric V-rings
- Improved friction behaviour
- Constant axial initial tension by using rubber springs at support ring
- Can be used in applications with both, metallic or laminated fabric guide bushes
- Availability in open or endless version
- Mounting in non-adjustable housings

Material

Pressure ring

Material	Designation	Coöor
PTFE-Bronze	PTFE B570	brown

Roof-shaped ring

Material	Designation	Coöor
Cotton fabric/NBR	BI-NBR	black

Support ring

Material	Designation	Coöor
Cotton fabric/NBR	BI-NBR	black

Other material combinations available on request.

Application

- Seal set for tough applications and large extrusion gaps.

Operating conditions

Material	NBR
Hydraulic oils HL, HLP	-30 ... +100
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-
Water	-
HETG (rapeseed oil)	-30 ... +80
HEES (synthetic ester)	-30 ... +80
HEPG (glykol)	-30 ... +60
Mineral greases	-30 ... +100
Pressure	40 MPa
Running speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Profile bearing length ratio $M > 50\%$ up to max. 90% with average depth $c = R_z/2$ and reference line C ref = 0%. $c = R_z/2$ and reference line Cref = 0 %

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface.

A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{p_x}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. (See also *Merkel Technical Manual*).

The maximum permissible extrusion gap with a one-sided position of the piston is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material.

Profile dimension	Max. permissible gap dimension			
	16 MPa	26 MPa	32 MPa	40 MPa
7,5	0,65	0,60	0,55	0,50
10	0,70	0,65	0,60	0,55
12,5	0,75	0,70	0,65	0,60
15	0,80	0,75	0,70	0,65
20	0,95	0,90	0,85	0,80
25	1,00	0,95	0,90	0,85
30	1,10	1,05	1,00	0,95

Tolerances

Diameter	Tolerances
D	H8/f8

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Design notes

For the mounting an axial accessible installation space is necessary. For new designs we recommend to consider the use of a modern sealing system. Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

For an ideal result, please comply with the mounting sequence as described in the following:

- Before mounting, all single parts of the sealing set must be equally coated with a thin layer of grease or oil.
- The piston rod must be installed in the cylinder before mounting.
- Each part of the sealing set must be placed individually. Please begin with the support ring, continue with each V-ring and end the mounting with the pressure ring.
- Please do not twist the V-rings while mounting. If air cushions are trapped between the V-rings, the rings can not be placed in their final position. In this case, please relieve the pressure by partially lifting each sealing edge with a smooth-edged tool. Finally adjust the fitting of each V-ring in the housing.

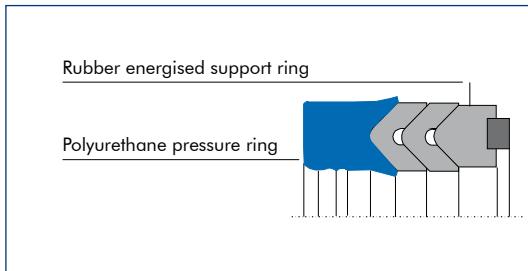

Additional details for the mounting of open roof shaped seal sets:

- To assure sufficient oil tightness of open roof shaped seal sets, these versions are generally delivered oversized regarding circumference and with layed-in Profiled rubber strings of each split V-shaped ring of the seal set. Therefore, never split an endless seal set in order to use it as an open version of the same size.
- The mounting of an open seal set is sequently done as described above. For each part of the seal set, primarily start to mount both ends of the split ring into the housing while aligning and pressing both ends together thoroughly. Then continue to insert the opposite part of the ring. Arrange equally the two remaining oversize slopes of the ring, and push them into the housing as well. Once inserted, each ring finally can be equally guided and pushed in its final position.
- While mounting V-rings of an open seal set, air cushions can be trapped as well. In this case, please relieve the pressure by partially lifting each sealing edge with a smooth-edged tool. Finally adjust the fitting of each V-ring in the housing.
- While mounting an open roof shaped seal set, please make sure, that the position of the cutting site of each ring has an offset of 120° to its neighbours.

Please note our general remarks for the mounting of hydraulic seals in the Merkel Technical Manual.

Merkel Roof Shaped Seal Type ES 81

Product description

Multipart seal set for sealing piston rods, comprising one polyurethane pressure ring with a grooved contact surface on the inner diameter, rubber-fabric V-rings and one rubber energised support ring.

Product advantages

- High sealing capability due to modern PU pressure ring with Finite-Element-Analysis-optimised design.
- Additional static sealing edge to prevent air flow from the outside in case of low-pressure in the sealing system.
- Improved friction behaviour due to grooved contact surface.
- High extrusion resistance by using robust PU pressure ring.
- Functional safety in case of pressure peaks by using inherently stable PU pressure ring.
- Constant axial initial tension by using rubber springs at support ring.
- Availability in open or endless version.
- Mounting in non-adjustable housings.

Material

Pressure ring

Material	Designation	Color
Polyurethane	94 AU 925	Light blue

Roof shaped seal

Material	Designation	Color
Fabric/nitrile rubber	BI-NBR	Black

Support ring

Material	Designation	Color
Fabric/nitrile rubber	BI-NBR/NBR	Black

Application

- Existing designs
- Temporary low-pressure

Operating conditions

Material	NBR
Hydraulic oils HL, HLP	-30 ... +100
HFA fluids	+5 ... +50
HFB fluids	+5 ... +50
HFC fluids	-30 ... +40
HFD fluids	-
Water	+5 ... +40
HETG (rapeseed oil)	-30 ... +60
HEES (synthetic ester)	-30 ... +60
HEPG (glykol)	-30 ... +40
Mineral greases	-30 ... +100
Pressure	40 MPa
Running speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Profile bearing length ratio $M > 50\%$ up to max. 90% with average depth $c = R_z/2$ and reference line C ref = 0%. $c = R_z/2$ and reference line Cref = 0 %

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface.

A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{k_x}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. (See also *Merkel Technical Manual*).

The maximum permissible extrusion gap with a one-sided position of the piston is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material.

Profile dimension	Max. permissible gap dimension			
	16 MPa	26 MPa	32 MPa	40 MPa
7,5	0,55	0,45	0,4	0,35
10	0,6	0,5	0,45	0,4
12,5	0,6	0,5	0,45	0,4
15	0,65	0,55	0,45	0,4
20	0,7	0,6	0,5	0,45
25	0,75	0,65	0,55	0,5
30	0,8	0,7	0,6	0,55

Tolerances

Recommended fit, if a both-sided metallic guiding is used:

Diameter d	Tolerance
≤ 800	H8 / f8
> 800	+0,1 / f7

Diameter D	Tolerance
≤ 800	H8 / f8
> 800	+0,1 / f7

Design notes

For the mounting an axial accessible installation space is necessary. For new designs we recommend to consider the use of a modern sealing system. Please note our general design remarks in the Merkel Technical Manual.

Installation and assembly

For an ideal result, please comply with the mounting sequence as described in the following:

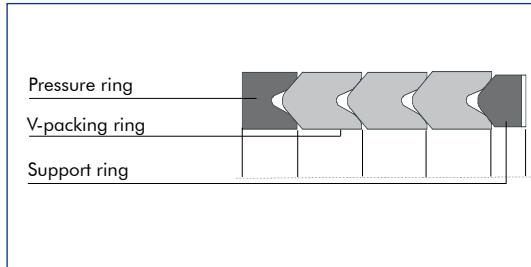

- Before mounting, all single parts of the sealing set must be equally coated with a thin layer of grease or oil.
- The piston rod must be installed in the cylinder before mounting.
- Each part of the sealing set must be placed individually. Please begin with the support ring, continue with each V-ring and end the mounting with the pressure ring.
- Please do not twist the V-rings while mounting. If air cushions are trapped between the V-rings, the rings can not be placed in their final position. In this case, please relief the pressure by partially lifting each sealing edge with a smooth-edged tool. Finally adjust the fitting of each V-ring in the housing.

Additional details for the mounting of open roof shaped seal sets:

- To assure sufficient oil tightness of open roof shaped seal sets, these versions are generally delivered oversized regarding circumference and with layed-in Profiled rubber strings of each split V-shaped ring of the seal set. Therefore, never split an endless seal set in order to use it as an open version of the same size.
 - The mounting of an open seal set is sequently done as described above. For each part of the seal set, primarily start to mount both ends of the split ring into the housing while aligning and pressing both ends together thoroughly. Then continue to insert the opposite part of the ring. Arrange equally the two remaining oversize slopes of the ring, and push them into the housing as well. Once inserted, each ring finally can be equally guided and pushed in its final position.
 - While mounting V-rings of an open seal set, air cushions can be trapped as well. In this case, please relief the pressure by partially lifting each sealing edge with a smooth-edged tool. Finally adjust the fitting of each V-ring in the housing.
- While mounting an open roof shaped seal set, please make sure, that the position of the cutting site of each ring has an offset of 120° to its neighbours.

Please note our general remarks for the mounting of hydraulic seals in the Merkel Technical Manual.

Merkel V-Packing V 1000

Product description

V-packings are used for sealing piston rods, plungers and, in exceptional cases, pistons. Due to their robust design, these are very good for use in highly demanding, heavy and horizontal compressors, especially when the plungers are subjected to large side forces. V-packings can even be employed when piston rods or plungers can no longer be safely used due to excessive wear. Because of their good post-tensioning properties and robust design, V-packings in combination with thrust collars and backup-rings are used mainly in the demanding field of heavy hydraulics.

V-packing rings are delivered open, with an internal diameter of up to 400 mm, dependent on the nominal diameter requested.

In the case of larger diameters the rings are given additional length and must be fitted exactly in the compression packing. Endless rings can also be delivered on request.

If no design, fluid or temperature details are provided, the delivered goods will be those listed as standard productions B/B (see table on fields of application)

Material

Material	Designation	Color
Cotton fabric/ NBR	BI-N B6B210	black
Cotton fabric/ NBR	BI-N B6A151	black

Operating conditions

Material	BI-N B6B210 BI-N B6A151
Hydraulic oils HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rapeseed oil)	-30 ... +80 °C

HEPG (glykol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

Determination of the housing

The dimensions of the V-Packing 1000 are given in the following lists. Correct dimensioning of the seals is very important for both operating safety and service life, since too small a Profile width can give rise to operating difficulties and can reduce the service life. In terms of the nominal diameters required, we recommend the following Profile widths.

Nominal Ø d	Profile width B
... 25	7,5
> 25 ... 80	10
> 80 ... 120	12,5
> 120 ... 250	15
> 250 ... 500	20
> 500 ... 1000	25
> 1000	30

V-packings are delivered with a height plus tolerance. The fitting areas must therefore be correspondingly adjustable in the axial direction. The number and height of the shims below the gland depends on the Profile width and thereby also on the set height. The recommended minimum z values and the recommended lead-in chamfers are indicated in the table.

Profile width B	7,5	10	12,5	15	20	25	30
Tightening dimension z	Ø ≤500	4	8	10	12	15	20
	Ø >500	5	6,5	7,5	10	12,5	15

Fits

Diameter D	Clearance fit	Housing diameter D
... 80	H9/f8	H11
>80 ... 120	H8/f8	
>120 ... 500	H8/e8	
>500 ... 630	450 µm	
>630 ... 800	500 µm	
>800 ... 1000	550 µm	
>1000 ... 1250	700 µm	
>1250 ... 1600	750 µm	
>1600 ... 1800	850 µm	
>1800	950 µm	

To obtain the desired sealing effect from open or pre-cut seal sets the length of the circumference must be larger than that calculated from the nominal diameter. The specific added length effects the required pressing in the joint section.

V-packings with a nominal diameter of up to 400 mm

These packings have the correct assembly dimensions. They can be fitted without any further advance preparation.

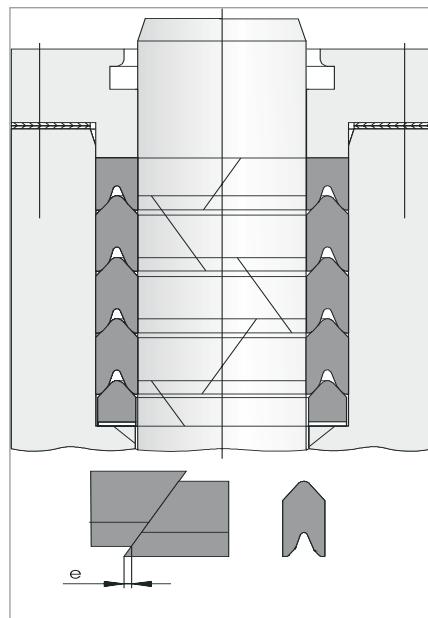

V-packings with a nominal diameter of more than 400 mm

Changes in circumference length can occur if the packings are stored for very long periods or are subjected to a variety of environmental influences. For this reason these sizes are always delivered with an extra circumference length.

Packings with a nominal diameter of over 400 mm must therefore be cut to the required size immediately prior to use: nominal length of circumference plus extra length "e" in accordance with the table. This table applies to the packings and to the thrust collars. The backup are cut at a blunt angle such that, when centred in the packing seal, they have a gap of 1 to 5 mm. Any plastic back-up rings will be given an oblique cut to fit exactly.

Fitting & installation

Careful fitting is a prerequisite for correct function of the seal. When assembling, each ring is placed singly in the seal housing – the joint section first – at the same time. The joint sections must be positioned as indicated in the illustration "position after installation" and should be offset, from ring to ring, at an angle of 120°, as shown in the illustration. Before installation, the seals should be lubricated. It is beneficial to use a neutral, compatible grease. This grease greatly reduces friction and also make the assembly easier. On tightening the gland, all of the rings in the seal set are brought into their final position.

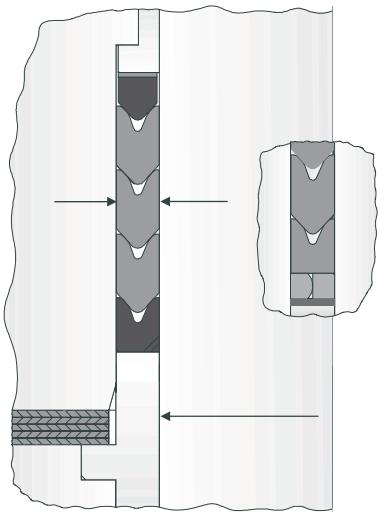

$\varnothing d$	Added length
200 ... 250	7
>250 ... 500	9
>500 ... 750	12
>750 ... 1000	15
>1000 ... 1500	20
>1500 ... 2000	25

The technical drawing illustrates three types of rod seals: Type A, Type B, and Type C. Type A is shown as a series of three segments. Type B has a small white square protrusion at the end. Type C has a larger white square protrusion. To the right is a detailed cross-sectional view of Type A, labeled 'rounded and burr-free'. It shows a central vertical column with a top width of $C \times 15^\circ$, a height of $L^{+0,2}$, and a bottom width of $C \times 15^\circ$. The distance from the base to the center of the top edge is Z . The overall height is $\varnothing D$ and the inner height is $\varnothing d$.

Merkel V-Packings-Sets with Inch Dimensions.

The technical drawing illustrates three types of Merkel V-Packings-Sets:

- Type A:** Shows a single row of V-grooves.
- Type B:** Shows a double row of V-grooves.
- Type C:** Shows a triple row of V-grooves.

A detailed cross-sectional view shows the following dimensions:

- Outer diameter:** $\emptyset D$
- Inner diameter:** $\emptyset d$
- Width:** $L^{+0,2}$
- Height:** z
- Angle:** $C \times 15^\circ$
- Material thickness:** $L^{+0,2}$

Material: BI-N B6A151 or BI-N B6B210

Other material combinations are available on request.

Application

The OMK-MR is used for pistons with pressure from both sides.

Operating conditions

Material	PTFE B602/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-
Water	-
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Product description

Two-piece seal set for sealing pistons, consisting of a PTFE profile ring and an O-ring as the preloading element.

Product advantages

- enhanced operating reliability with tough operating parameters
- no „blow by“ with fast load changes, due to pressure activation grooves
- very good pressure resistance capability and hardness
- good thermal conductivity
- high resistance to abrasion
- low friction, stick-slip-free

Material

PTFE profile ring

Material	Designation	Color
PTFE-bronze	PTFE B602	brown
PTFE-carbon-fiber compound	PTFE C104	light grey

Other material combinations are available on request.

Operating conditions

Material	PTFE GM201/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05µm	< 0,30µm
R _{max}	< 2,5µm	
R _{p_x}	< 0,5µm	
R _{p_k}	< 0,5µm	
R _k	>0,25µm	<0,7µm
R _{v_k}	>0,2µm	<0,65µm
R _{v_{kx}}	>0,2µm	<2,0µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterparts.

Gap dimension

The dimension d2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. (See also *Merkel Technical Manual*).

The maximum permissible extrusion gap with a one-sided position of the piston is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material.

Profile dimension		Max. permissible gap dimension			
L	Profile	16 MPa	26 MPa	32 MPa	40 MPa
2,2	2,45	0,35	0,3	–	–
3,2	3,75	0,4	0,35	–	–
4,2	5,5	0,5	0,4	0,3	–
6,3	7,75	0,55	0,45	0,4	0,35
8,1	10,5	0,6	0,5	0,45	0,45
8,1	12,25	0,7	0,6	0,55	0,5

At an operating temperature of above 90°C, and simultaneous exposure to an operating pressure of more than 26 MPa, we recommend the use of the material compound PTFE B602 and PTFE C104.

Tolerances

Diameter d	Tolerance
< 500	h8
> 500	h7

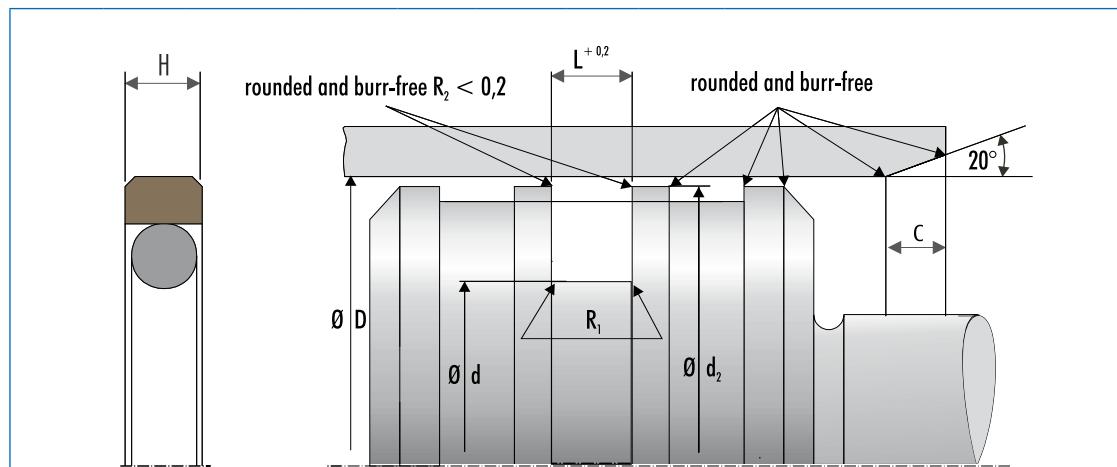

The tolerance for the diameters D and d2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

Please note our general remarks on hydraulic seal assembly in the *Merkel Technical Manual*.

The technical drawing illustrates the cross-section and side view of a piston seal. The cross-section shows a housing of height H containing a piston with diameter D. The side view shows the piston seal profile with various dimensions: D (outer diameter), d (inner diameter), L (length), C (width of the sealing lip), R₁ (radius of the top corner), and R₂ (radius of the bottom corner). The side view also indicates a 20° angle for the sealing lip entry. The top of the seal has a rounded and burr-free finish with a radius < 0,2.

The technical drawing illustrates the cross-section and side view of a piston seal. The cross-section shows a housing of height H containing a piston of diameter D and height d. The side view shows the piston's profile with various dimensions: total height H, piston diameter D, piston height d, shoulder radius R1, shoulder diameter d2, profile thickness C, and a shoulder angle of 20°. The top part of the drawing specifies 'rounded and burr-free $R_2 < 0,2$ ' and indicates a tolerance of $L + 0,2$.

Merkel Omegat OMK-QR

Product description

Two-piece seal set for sealing pistons, consisting of a PTFE Profile ring and a NBR Profile ring as the preloading element.

Product advantages

- enhanced operating reliability with tough operating parameters
- no „blow by“ with fast load changes, due to pressure activation grooves
- very good pressure resistance capability and hardness
- good thermal conductivity
- high resistance to abrasion
- low friction, stick-slip-free

Material

PTFE Profile ring

Material	Designation	Color
PTFE-bronze	PTFE B602	brown
PTFE-carbon-fiber compound	PTFE C104	dark grey

Prestress element

Material	Designation	Color
Nitrile rubber	NBR	black

Other material combinations are available on request.

Application

The Omegat OMK-QR is used for pistons with pressure from both sides and heavy duty applications. Especially designed for large dimensions.

Operating conditions

Material	PTFE B602/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-
Water	-
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	5 m/s

Material	PTFE C104/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = R_z/2 and reference line Cref = 0 %

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Gap dimension

The dimension d₂ is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. (See also *Merkel Technical Manual*).

The maximum permissible extrusion gap with a one-sided position of the piston is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material.

Profile dimension		Max. permissible gap dimension			
L	Profile	16 MPa	26 MPa	32 MPa	40 MPa
2,2	2,45	0,35	0,3	–	–
3,2	3,75	0,4	0,35	–	–
4,2	5,5	0,5	0,4	0,3	–
6,3	7,75	0,55	0,45	0,4	0,35
8,1	10,5	0,6	0,5	0,45	0,45
8,1	12,25	0,7	0,6	0,55	0,5
9,5	14,0	0,75	0,65	0,6	0,55

At an operating temperature of above 90°C, and simultaneous exposure to an operating pressure of more than 26 MPa, we recommend the use of the material compound PTFE B602 and PTFE C104.

Tolerances

Diameter d	Tolerance
< 500	h8
> 500	h7

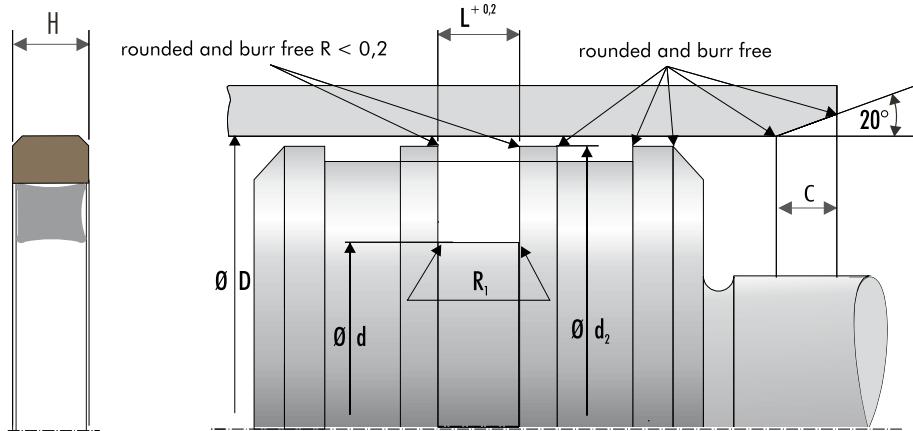

The tolerance for the diameters D and d2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or f7 and f8 are usually chosen.

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

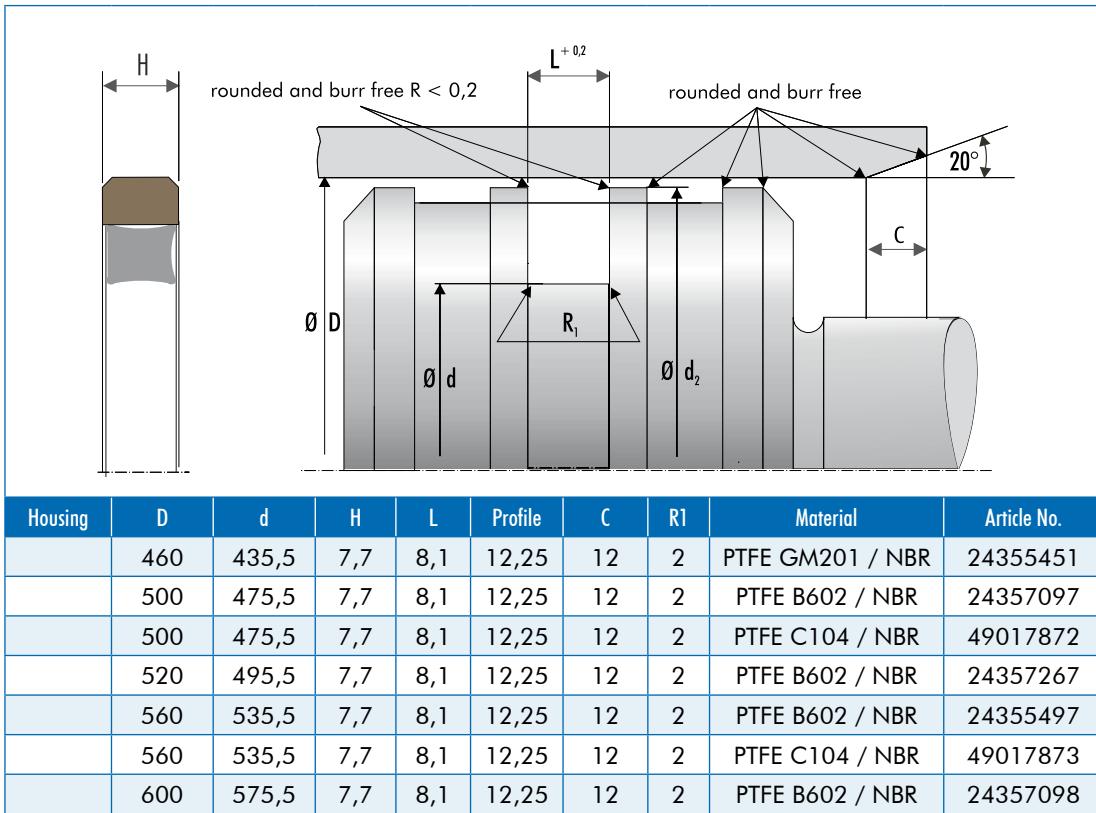

Installation & assembly

Please note our general remarks on hydraulic seal assembly in the *Merkel Technical Manual*.

Other material combinations and further dimensions are available on request.

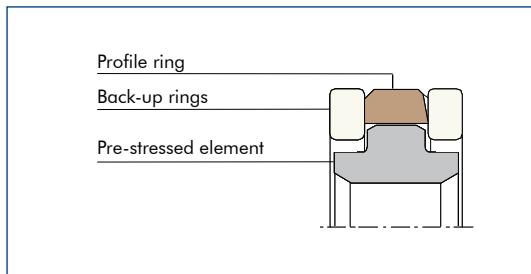

The technical drawing illustrates a piston seal assembly. On the left, a vertical cross-section shows a total height H and a top cap with a thickness of 2 mm. The main part features a housing diameter $\varnothing D$, a piston diameter $\varnothing d$, and a profile thickness L . The profile has rounded ends with a radius R_1 and a shoulder radius R_2 . The piston has a shoulder angle of 20° and a shoulder radius C . The drawing also includes a note: "rounded and burr free $R < 0,2$ ".

Merkel Compact Seal L 27

Product description

Four-piece piston seal set made of an elastomer pre-stressed element, two active back-up rings and one PTFE/bronze Profile ring.

Product advantages

- bridges large radial gaps
- very good resistance to extrusion, also at pressure peaks
- high resistance to abrasion
- high pressure force due to elastomer Profile ring
- low friction, stick-slip-free

Material

Profile ring

Material	Designation	Color
PTFE-Bronze-Compound	PTFE B602	brown

Pre-stressed element

Material	Designation	Color
Nitrile rubber	NBR	black

Back-up ring

Material	Designation	Color
Polyacetal	POM	white

Application

Compact seal for sealing pistons which can be pressurised on both sides. The activated back-up rings offer a high degree of protection against extrusion, also with breathing gaps.

Operating conditions

Material	NBR/PTFE/POM
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-
Water	-
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +50 °C
Mineral greases	-30 ... +100 °C
Pressure	50 MPa
Running speed	1,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Material content $Mr > 50\%$ to max. 90 %, with cut depth $c = R_z/2$ and reference line $Cref = 0\%$

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface.

A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.
See also *Merkel Technical Manual*.

Surface finish of the sliding surface

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Gap dimension

The dimension d₂ is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. (See also *Merkel Technical Manual*).

The maximum permissible extrusion gap with a one-sided position of the piston is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material

Profile dimension		Max. permissible gap dimension			
Diameter D	Profile	16 MPa	26 MPa	32 MPa	40 MPa
... 70	6,0	0,8	0,7	0,5	0,4
>70 ... 110	8,5	1,2	1,0	0,65	0,5
>110 ... 200	10,0	1,2	1,0	0,65	0,5
>200 ... 350	12,5	1,8	1,4	0,9	0,7

Tolerances

Diameter	Tolerance
d	h9

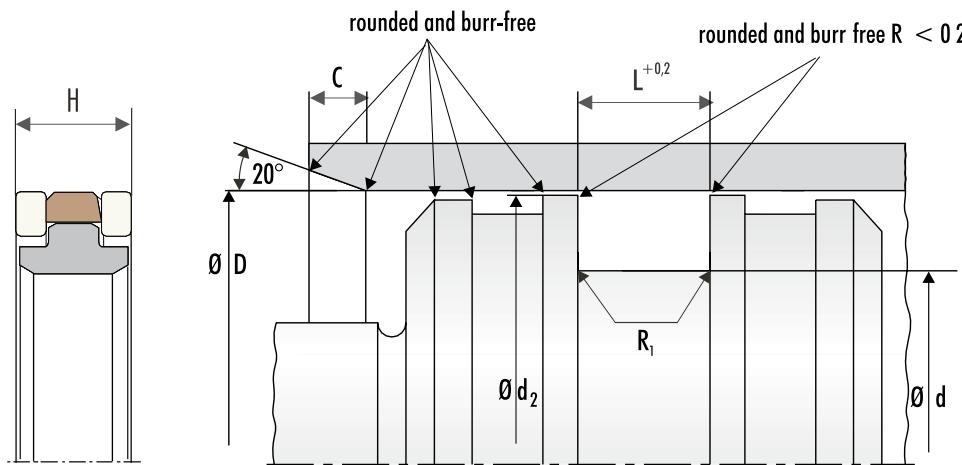

The tolerance for the diameters D and d₂ is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or f7 and f8 are usually chosen.

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

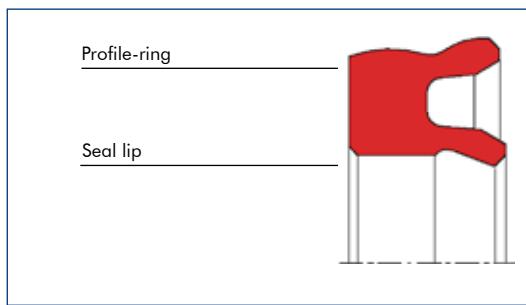

Please note our general remarks on hydraulic seal assembly in the *Merkel Technical Manual*.

Merkel Piston Seal TMP 21

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Material content Mr > 50 % to max. 90 %, with cut depth $c = R_z/2$ and reference line $Cref = 0 \%$. Abrasive surfaces, scores, scratches and blowholes are to be avoided.

Toleranzen

If the housing is designed according to our recommendations (see Merkel Technical Manual), the following tolerances can be chosen.

Diameter	Tolerance
D	H8
d_2	h9

Diameter d	Tolerance
<250	h11
>250	h10

Design notes

Please read our general design notes in the *Merkel Technical Manual*.

Housing recommendations for new design

d	D	d_s	L	C
>70 ... 220	D - 20	$d+6,5$	16	8,5
>125 ... 345	D - 25	$d+8,5$	20	10
>180 ... 660	D - 30	$d+10$	24	11,5
>440 ... 840	D - 40	$d+13,5$	32	12,5
>850 ... 1250	D - 50	$d+16,5$	40	16
>1060 ... 2000	D - 60	$d+20$	48	18

Applications

Piston seal which is mainly used in pneumatic cylinders in heavy-duty mechanical engineering.

Material

For diameter <500 mm

Material	Designation	Color
Polyurethane	93 AU V167	red

For diameter >500 mm

Material	Designation	Color
Polyurethane	93 AU V168	red

Operating conditions

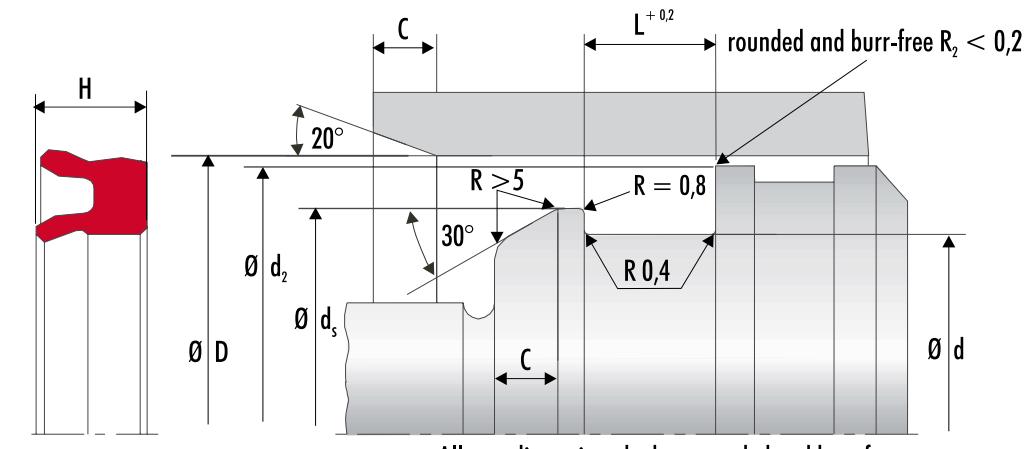

Material	93 AU V167/93 AU V168
Pneumatic: air dry or oiled	-10 ... +80 °C
Pressure	2 MPa
Running speed	1,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Installation & assembly

The piston seals can be mounted over the metallic support collar by hand or using an aid (mallet, slightly oil or grease seal). Please contact our application consultants about different housings, e.g. in old plants.

To achieve optimum running-in and operation behaviour, the U-rings should be oiled or greased slightly prior to use (initial lubrication).

The technical drawing illustrates the cross-section of a piston seal. Key dimensions include:

- Outer diameter: $\varnothing D$
- Inner diameter: $\varnothing d$
- Width: H
- Thickness: $\varnothing d_s$
- Length: L
- Profile thickness: C
- Angle at the top edge: 20°
- Radius at the top edge: $R > 5$
- Radius at the bottom edge: $R = 0,8$
- Radius at the shoulder: $R = 0,4$
- Length of the shoulder: $L^{+0,2}$
- Surface finish: "rounded and burr-free $R_2 < 0,2$ "

All non-dimensioned edges rounded and burr-free.

Merkel U-ring Seal Set 0215

Product description

Two-piece seal set comprising an elastomer U-ring with a fabric reinforcement on the running surface to ride over the sealing edge and an active back-up ring.

Product advantages

- low friction due to fabric reinforcement
- large dimension range
- resistant to extrusion owing to activated back-up ring

Applications

Single-acting piston seal for use in hydraulics or pneumatics.

Material

Profile ring

Material	Description	Color
Nitrile rubber	NBR	black
Cotton fabric	BI-NBR	black

Back-up ring

Material	Description	Color
D<300 mm Polyacetal	POM	white
D>300 mm Polyamide	PA	white

Other materials like PTFE/bronze back-up ring on request.

Operating conditions

Material	NBR/BI-NBR/POM or PA
Hydraulic oils HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rapeseed oil)	-30 ... +80 °C
HEES (synthetic esters)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure Hydraulic	25 or 40* MPa
Pressure Pneumatic	5 MPa
Sliding speed v in m/s	1,5 m/s

*max. pressure depends on the Profile

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = R_z/2 and reference line Cref = 0 %

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

Gap dimension

The dimension d2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance and the deflection of the guide under load.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Back-up ring height h	Max. permissible gap dimension			
	16 MPa	26 MPa	32 MPa	40 MPa
1,5	0,5	0,5	0,4	0,3
2,5	0,8	0,7	0,6	0,4
3,0	0,8	0,7	0,6	0,4
3,5	1,2	1,0	0,65	0,5
4,0	1,2	1,0	0,65	0,5
5,0	1,8	1,4	0,9	0,7
6,0	1,8	1,4	0,9	0,7
8,0	2,0	1,6	1,1	0,9

The largest gap width occurring in operation on the non-pressurised side of the seal is crucial for the functioning of the seal. See *Merkel Technical Manual*.

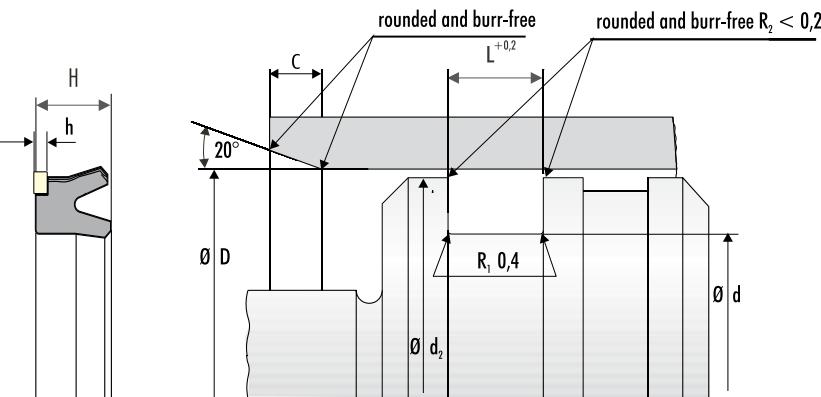

Tolerance

Diameter	Tolerance
D	H8
d ₂	h10

The tolerance for the diameter d2 is specified in connection with the gap dimension calculation. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Installation & assembly

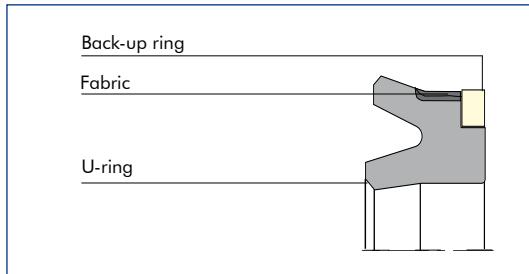

Careful assembly is a precondition for the perfect functioning of the seal. See *Merkel Technical Manual*.

Merkel Nutringdichtsatz Typ 0504

Product description

Two-piece Merkel seal set with asymmetrical profile, used as piston seal.

Product advantages

- Functional safety in case of radial shaft misalignment by using large profile overlap.
- Operational safety due to robust polyurethane Profile ring.
- High sealing function due to distinctive sealing edge (high line load).
- Safety against metallic contact due to large extrusion gaps by using back-up ring for high extrusion resistance.
- Easy and secure mounting.

Application

- Single seal for working pressures up to 50 MPa.
- Suitable for large extrusion gaps.
- Nominal diameter up to 2000 mm.

Material

Profile ring

Material	Designation	Color
Polyurethane	95 AU V142	dark blue

or

Material	Designation	Color
Polyurethane	94 AU 925	light blue

Back-up ring

Material	Designation	Color
Polyamide	PA	white

or

Material	Designation	Color
Polyoxymethylen	POM	white

The material is determined by the nominal diameter and the production process involved.

Operating conditions

Material	95 AU V142 94 AU 926
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +40 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +60 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Pressure	50 MPa
Running speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_x}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces. See also *Merkel Technical Manual*.

Gap dimension

The dimension D2 is determined by factoring in the maximum permissible extrusion gap, the tolerances, the guide clearance, the deflection of the guide under load, and the pipe expansion. See also *Merkel Technical Manual*.

The maximum permissible extrusion gap with a one-sided position of the piston rod is significantly determined by the maximum operating pressure and the temperature-dependent dimensional stability of the seal material. See also *Merkel Technical Manual*.

Profile dimension	Max. permissible gap dimension				
	16 MPa	26 MPa	32 MPa	40 MPa	50 MPa
10,0 ... < 15,0	0,7	0,7	0,7	0,6	0,5
15,0 ... 30,0	1,1	1,1	1,0	0,9	0,7

Tolerances

If the installation space is designed according to our housing recommendations (p. v. design notes), the following tolerances can be chosen:

Diameter	Tolerance
D	H8
d ₂	h9
Diameter D	Tolerance
≤ 250	h11
> 250	h10

Diameter D	Tolerance
≤ 500	h8
> 500	-0,1

If other housing dimensions are used, please contact our technical service.

Design notes

The U-Ring seal set Type 0504 is a single acting seal. We do not recommend a back-to-back arrangement, since there is the risk of pressure build-up between the seals during operation.

Housing recommendation

D	d	ds	L	C
> 70 ... 220	D - 20	d + 6,5	16	8,5
> 125 ... 345	D - 25	d + 8,5	20	10
> 180 ... 660	D - 30	d + 10	24	11,5
> 440 ... 840	D - 40	d + 13,5	32	12,5
> 840 ... 1250	D - 50	d + 16,5	40	16
> 1060 ... 2000	D - 60	d + 20	48	18

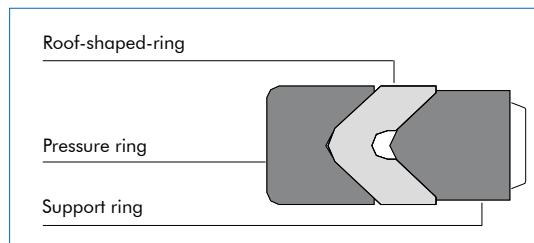

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

Dependent on the diameter ordered, the back-ring is delivered with a certain over-length and has to be cut to size just before mounting on site.

Reliable seal function is dependent on correct installation. See also *Merkel Technical Manual*.

Merkel Roof-Shaped Seal Set EK/EKV

Product description

Multi-part piston seal set comprising one thrust ring, one or two roof-shaped seals and one support ring.

Product advantages

- Field-proven under ultra-tough conditions long useful lifetime
- Can be optimally matched to the application concerned
- Functions for a certain period even on poor surfaces
- Not susceptible to soiling
- The leakage or friction behavior may alter, depending on the application or design concened.

Application

Seal set for tough applications, predominantly for spares supply at old installations.

EK/EKV Roof-Shaped Seal Sets can be used for one-sided applications or back-to-back for pistons.

Material

Pressure ring

Type	Material	Designation
EK	Cotton fabric/NBR	BI-NBR
EKV	Cotton fabric/FKM	BI-FKM

Roof-shaped-ring

Type	Material	Designation
EK	Cotton fabric/NBR	BI-NBR
EKV	Cotton fabric/FKM	BI-FKM

Type	Material	Designation
EK	NBR	85 NBR
EKV	FKM	85 FKM

Support ring

Type	Material	Designation
EK	Cotton fabric/NBR or POM	BI-NBR or POM
EKV	Cotton fabric/FKM	BI-FKM

Operating conditions

HFD fluids	-
Water	+5 ... +100 °C
HETG (rapeseed oil)	-30 ... +80 °C
HEES (synthetic ester)	-30 ... +80 °C
HEPG (glykol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Sliding speed	0,5 m/s

Material	BI-FKM/85 FKM
Hydraulic oils HL, HLP	-15 ... +140 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	+5 ... +60 °C
HFD fluids	-15 ... +140 °C
Water	+5 ... +80 °C
HETG (rapeseed oil)	-15 ... +80 °C
HEES (synthetic ester)	-15 ... +100 °C
HEPG (glykol)	-15 ... +80 °C
Mineral greases	-15 ... +140 °C
Pressure	40 MPa
Sliding speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long-time behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart.

A precise description and assessment of the surface is thus indispensable.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, the hitherto merely general description of the material content is significantly improved, not least in regard to the abrasiveness of the surface.

See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterpart surfaces.

See also *Merkel Technical Manual*.

Design notes

Nominal Ø D	d

Further dimensions are available on request.

The technical drawing illustrates a piston seal with various dimensions labeled:
 - Height: H
 - Inner diameter: Ø d
 - Outer diameter: Ø D
 - Length: L
 - Width: C
 - Side clearance: Ø d_{1,-0,3}
 - Angle: 15°
 - Top edge profile: rounded and burr-free
 - Cross-sections show the seal's profile and its installation in a housing.

Further dimensions are available on request.

The technical drawing illustrates a piston seal with various dimensions labeled: H , d , D , d_1 , L , C , and $\text{L}^{+0,3}$. A note above the drawing specifies "rounded and burr-free". A cross-sectional view on the right shows the internal profile with a 15° angle and a dimension $\text{d}_{1,0,3}$.

Merkel Double Wiper PT 1

Material

PTFE profile ring

Material	Designation	Color
PTFE-glass-fiber-MoS ₂ compound	PTFE GM201	light grey

O-ring

Material	Designation
Nitrile rubber	NBR

Product description

Double wiper, consisting of a PTFE profile ring with one sealing and one wiping edge, plus two O-rings as preloading elements.

Product advantages

- enhanced functional reliability of the sealing system, thanks to additional sealing edge
- high operating reliability, thanks to sturdy profile ring made of PTFE compound (can briefly withstand the full operating pressure)
- very good wiping capability for dirt adhering, thanks to dimensionally stable wiping edge
- excellent control and positioning characteristics thanks to favorable frictional behavior (stick-slip-free)

Applications

Double wiper for improving overall sealing capabilities. The PT 1 is preferably used in conjunction with our rod seals OMS-MR PR or T 20.

Operating conditions

Material	PTFE GM 201/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	+30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	5 m/s

Operating conditions

Material	PTFE B206/FKM
Hydraulic oils, HL, HLP	-10 ... +200 °C
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-10 ... +200 °C
Water	-
HETG (rape-seed oil)	-10 ... +80 °C
HEES (synth. ester)	-10 ... +100 °C
HEPG (glycol)	-10 ... +80 °C
Mineral greases	-10 ... +200 °C
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = $R_z/2$ and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterparts. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
Ra	> 0,05 µm	< 0,30 µm
Rmax	< 2,5 µm	
Rpkx	< 0,5 µm	
Rpk	< 0,5 µm	
Rk	> 0,25 µm	< 0,7 µm
Rvk	> 0,2 µm	< 0,65 µm
Rvkx	> 0,2 µm	< 2,0 µm

Tolerances

Diameter	Tolerance
D	H9
D1	H10

The tolerance for the diameter d is specified in connection with the gap dimension calculation for the primary seal. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 are usually chosen.

Design notes

We recommend a pressure-relief bore. In the case of upstream seals with a good return capability, a pressure-relief feature is not necessary.

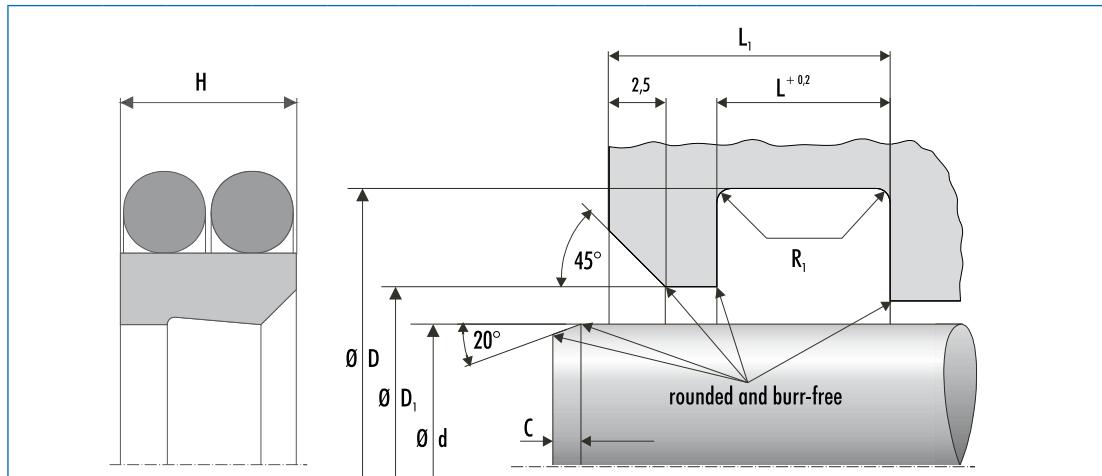

Installation & assembly

Reliable seal function is dependent on correct installation. See also *Merkel Technical Manual*

Merkel Double Wiper PT 2

Product description

Double wiper PT 2, consisting of one profile ring with one sealing edge and one wiper edge, plus two O-rings as prestress elements

Product advantages

- The wipers additional static sealing zone (dirt deflector) flush-fits with the housing and leaves no space for any dirt clusters.
- Outstanding ability to wipe-off sticky dirt by inherently stable wiper edge.
- Improved functional reliability of the complete sealing system due to the wipers' additional sealing edge.
- Stick-slip free operation by customised choice of materials (friction coefficient)

Material

PTFE Profile ring

Material	Designation	Color
PTFE bronze compound	PTFE B602	brown
PTFE-glass-fibre-MoS ₂ compound	PTFE GM201	light grey

O-rings

Material	Designation
Nitrile rubber	NBR

Application

- Upwards motion of cylinder rods
- Dirt sticking to cylinder rods
- Improvement of the system leakage behaviour

Operating conditions

Material	PTFE B602/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-
Water	-
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	5 m/s

Material	PTFE GM201/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	+30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = R_z/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}		< 2,5 µm
R _{p_x}		< 0,5 µm
R _{p_k}		< 0,5 µm
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Tolerances

Diameter	Tolerance
D	H8
D1	H8

The tolerance for the diameter D is specified in connection with the gap dimension calculation for the primary seal. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields H7 and H8 are usually chosen.

Design notes

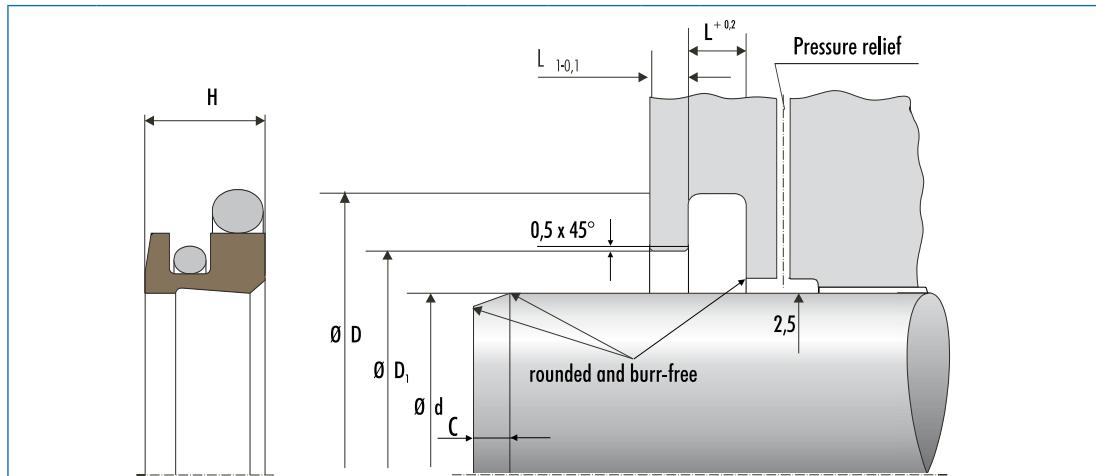

- In the space between the seal and the double wiper PT 2 a pressure relief bore must be integrated.
- PT 2 double wiper with a diameter d < 100 mm can not be mounted in pierced grooves. For the basic diameter range 50 mm > d < 100 mm a special version of the PT 2 wiper with 3 O-rings can be ordered. Basic diameters of the PT 2 wiper with d < 50 mm are presently not available. In this case, please ask for support.

Please note our general design remarks in the *Merkel Technical Manual*.

Installation & assembly

For the mounting within the basic diameter range 100 mm > d < 150 mm we recommend the use of a mounting tool. See also *Merkel Technical Manual*

See also *Merkel Technical Manual*.

The technical drawing illustrates a wiper component with various dimensions labeled: H, D, D₁, L, L₁, R₁, and C. A separate detail shows a pressure relief valve with dimensions L, L₁, and L₂. The component is described as 'rounded and burr-free'.

Merkel Double Wiper PT 3

Product description

Double wiper, consisting of a PTFE profile ring with one sealing and one wiping edge, plus two O-rings as preloading elements.

Product advantages

- enhanced functional reliability of the sealing system, due to additional sealing edge
- high operating reliability, due to sturdy profile ring made of PTFE compound (can briefly withstand the full operating pressure)
- very good wiping capability for dirt adhering, due to dimensionally stable wiping edge
- excellent control and positioning characteristics due to favorable frictional behavior (stick-slip-free)

Material

PTFE profile ring

Material	Designation	Color
PTFE-bronze compound	PTFE B602	brown
PTFE-glass-fiber-MoS ₂ compound	PTFE GM201	light grey

O-ring

Material	Designation
Nitrile rubber	NBR

Other material combinations are available on request.

Application

- Double wiper with integrated sealing function towards the outside diameter to improve the sealing functionality of the complete sealing system. PT 3 ideally used in combination with our piston seals.
- We generally recommend the use of a pressure relief bore, and it is a must, if an upstream seal is mounted with a poor ability to retract media. This pressure relief function is not vital, if an upstream seal is mounted with a sufficient ability to retract media.

Operating conditions

Material	PTFE B602/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	-
HFB fluids	-
HFC fluids	-
HFD fluids	-
Water	-
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	5 m/s

Material	PTFE GM 201/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	+30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = R_z/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05µm	< 0,30µm
R _{max}		< 2,5µm
R _{p_x}		< 0,5µm
R _{p_k}		< 0,5µm
R _k	>0,25µm	<0,7µm
R _{v_k}	>0,2µm	<0,65µm
R _{v_{kx}}	>0,2µm	<2,0µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces. See also *Merkel Technical Manual*.

Tolerances

Diameter	Tolerance
d	h9
d ₁	h10

The tolerance for the diameter d is specified in connection with the gap dimension calculation for the primary seal. In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 are usually chosen.

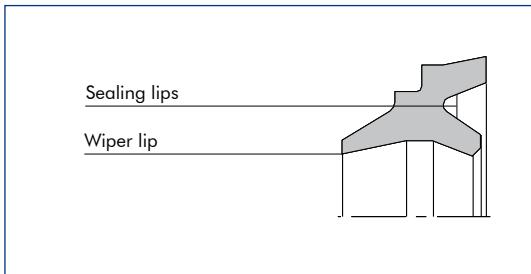

Design notes

We recommend a pressure-relief bore. In the case of upstream seals with a good return capability, a pressure-relief feature is not necessary.

Installation & assembly

Reliable seal function is dependent on correct installation. See also *Merkel Technical Manual*

Merkel Double Wiper P 8

Product description

Double-acting elastomer dirt wiper.

Product advantages

- Strong wiping action against dirt
- Very good sealing effect against residual film of oil on the extending rod
- Wear-resistant

Material

Material	Designation	Color
Nitrile rubber	NBR	black

Other materials on request.

Applications

Inwardly, the Merkel double wiper P 8 exercises the stripping function of a lip seal, and outwardly a wiper effect against dirt.

The P 8 double wiper is principally used in conjunction with our rod sealing system. In order to prevent a pressure build-up between the seal and the wiper, we definitely recommend providing a pressure relief borehole in front of the double wiper.

Operating conditions

Material	85 NBR B247
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	2 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	*	*
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

* Surface roughness of the sliding surface to suit the sealing component used.

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

Design notes

Please note our general design-related remarks in the *Merkel Technical Manual*.

Tolerance recommendation

Nominal-Ø d	D	D ₁	D ₂
16 ... 1000	H10	H11	H10

The tolerance for the diameter d is determined by the buffer seal.

Installation chamfers

Length and angle must be executed to suit the rod seal being used.

Installation & assembly

Careful installation is a prerequisite for the correct function of the wiper. Generally, wipers can be quickly and easily fitted by deforming into a kidney shape. Please note our general remarks on the installation of hydraulic seals in the *Merkel Technical Manual*, assembling hydraulic seals.

Merkel Double Wiper P 9

Product description

Elastomer double wiper, particularly suitable for large diameters.

Product advantages

- Intermediate sizes possible without mold/tool
- High wiper effect against dirt
- Very good sealing effect against residual oil film on the exiting rod
- Wear-resistant

Material

Material	Designation	Color
Nitrile rubber	NBR	black

Applications

Inwardly, the P 9 double wiper exercises the wiper function of a lip seal, and outwardly a wiper effect against soiling. The P 9 double wiper is preferably used in conjunction with rod sealing systems.

In order to avoid a pressure build-up between the seal and the wiper, a pressure-relief borehole should be provided before the wiper.

The P 9 double wiper is preferably used in conjunction with our rod sealing systems.

Operating conditions

Material	NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Running speed	2 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	*	*
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

* Surface roughness of the sliding surface to suit the sealing component used.

Design notes

Please note our general design-related remarks in the *Merkel Technical Manual*.

Tolerance recommendation

Nominal-Ø d	D	D ₁
20 ... 2900	H10	H11

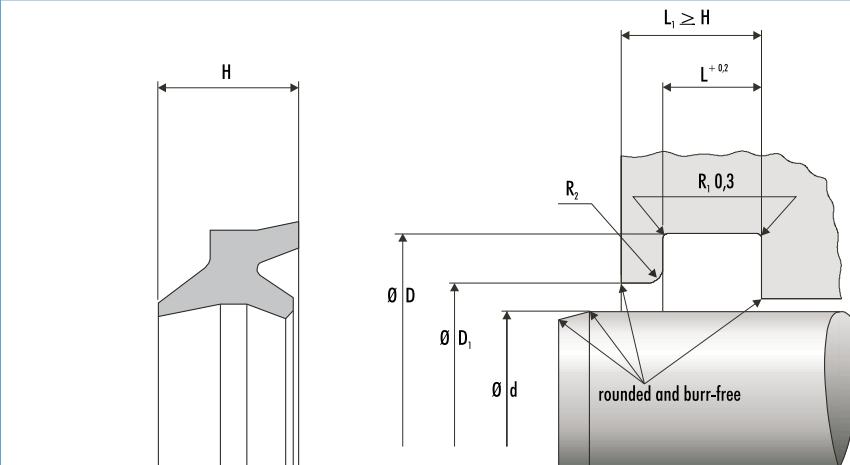

The tolerance for the diameter d is determined by the buffer seal.

Installation chamfers

Length and angle must be executed to suit the rod seal being used.

Installation & assembly

Careful installation is a prerequisite for the correct function of the wiper. Generally, wipers can be quickly and easily fitted by deforming into a kidney shape. Please note our general remarks in the *Merkel Technical Manual*.

The technical drawing illustrates the profile of a wiper blade. It features a central vertical slot of height H. On either side of this slot, there are two flaps. The top flap has a horizontal width of $L_1 \geq H$ and a thickness of $L^{+0.2}$. The bottom flap has a thickness of $R_1, 0.3$. The main body of the blade has a diameter of $\varnothing D$, a shoulder of $\varnothing D_1$, and a base of $\varnothing d$. The transition between the shoulder and the base is labeled as "rounded and burr-free".

Merkel Double Wiper PU 11

Product description

Lip seal with molded-on wiper lip (double-lip wiper); sealing edge of wiper lip slightly rounded

Product advantages

Double wiper for improving the overall sealing effect; dimensions for standardized installation spaces as per ISO 6195 Type C.

- Inwardly directed sealing lips provide the function of a lip seal
- Wiper lip with a slightly rounded sealing edge can be relied upon to strip off dirt, and leaves a residual film of oil on the entering rod, with concomitant benefits for the sealing effect, the lifetime and the friction behavior.

Material

Material	Designation	Color
Polyurethane	95 AU V142	blau

Applications

The P 11 double wiper is preferably used in conjunction with our OMS-MR rod seals. The PU 11 can cope with pressures of up to 1.6 MPa. If higher pressures may be encountered, we recommend a pressure-relief borehole between the seal and the wiper.

Operating conditions

Material	95 AU V142
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +50 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Running speed	1 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	*	*
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

* Surface roughness of the sliding surface to suit the sealing component used.

Tolerance recommendation

Nominal-Ø d	D	D ₁
12 ... 200	H10	H11

The tolerance for the diameter d is determined by the upstream seal.

Design notes

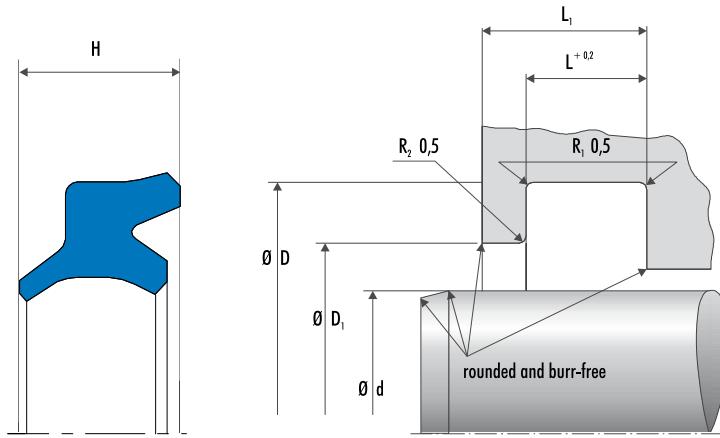

Please note our general design-related remarks in the *Merkel Technical Manual*.

Installation chamfers

Length and angle must be executed to suit the rod seal being used.

Installation & assembly

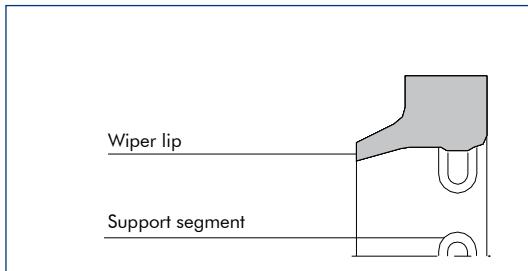

Careful installation is essential if the stripper is to function flawlessly. The strippers can be quickly and easily installed by compressing them into a kidney shape. Please note our general remarks on the installation of hydraulic seals in the *Merkel Technical Manual*.

Merkel Wiper P 6

Product description

Single-acting elastomer dirt wiper with support segments to avoid twisting.

Product advantages

- Good seal in the outer diameter
- Very good wiping action
- Wiper can be used for a wide temperature range
- No twisting in the housing and no pressure build-up between seal and wiper

Material

Material	Designation	Color
Nitrile rubber	NBR	black
Fluoroelastomer	FKM	black

Applications

The P 6 dirt wiper is principally used in the large-diameter range for standard applications.

Operating conditions

Material	85 NBR B247
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C

Further dimensions are available on request.

The technical drawing illustrates the cross-section of a wiper blade profile. Key dimensions labeled include: height H , outer width ΘD , inner width ΘD_1 , thickness Θd , profile thickness L , and a top gap $L_i \leq H$. The profile features a rounded end with a radius $R_1 = 0,4$ and a burr-free surface. A note specifies $L_i \leq H$ and $L_i + 0,2$.

Merkel Wiper PU 6

Product description

Dirt wiper with support segments at the stripping heel and a slightly rounded wiper lip.

Product advantages

- Additional static sealing edge at the outer diameter
- Prevents dirt and splash water entering, stops dirt reliably
- Leaves a residual film of oil on the entering rod
- High wear-resistance
- Does not twist in the installation space, and no pressure builds up between the seal and the wiper.

Material

Diameter <320

Material	Designation	Color
Polyurethane	95 AU V149	dark blue

Diameter >320

Material	Designation	Color
Polyurethane	93 AU V142	dark blue

Diameter >480

Material	Designation	Color
Polyurethane	93 AU V168	light blue

Operating conditions

Material	95 AU V149 95 AU V142 93 AU V168
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +50 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Running speed	2 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	*	*
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

* Surface roughness of the sliding surface to suit the sealing component used.

Tolerance recommendation

The tolerance for the diameter d is determined by the upstream seal.

Installation chamfers

Length and angle must be executed to suit the rod seal being used.

Design notes

Please note our general design-related remarks in the *Merkel Technical Manual*.

Installation & assembly

Careful installation is essential if the stripper is to function flawlessly. The strippers can be quickly and easily installed by compressing them into a kidney shape. Please note our general remarks on the installation of hydraulic seals in the *Merkel Technical Manual*.

Merkel Wiper PU 12

Product description

Single-acting dirt wiper towards the outside diameter, made of polyurethane with support segments, and a static sealing edge facing the groove.

Product advantages

- Very good wiping action due to inherently stable and wear & tear resistant wiper lip made of polyurethane.
- Secure collection of the remaining drag oil at the return stroke due to rounded wiper lip.
- Additional static sealing lip prevents ingress of dirt via the groove.
- Support segments offer stable positioning in the housing and assure high functional safety.

Material

Material	Designation	Color
Polyurethane	95 AU V149	dark blue

Material	Designation	Color
Polyurethane	93 AU V142	dark blue

Material	Designation	Color
Polyurethane	94 AU 925	light blue

The material is determined by the nominal diameter and the production process involved.

Application

Single acting dirt wiper for outer sealing applications.

Operating conditions

Material	95 AU V149 93 AU V142 94 AU 925
Hydraulic oils, HL, HLP	-30 ... +110
HFA fluids	+5 ... +50
HFB fluids	+5 ... +50
HFC fluids	-30 ... +40
HFD fluids	-
Water	+5 ... +50
HETG (rape-seed oil)	-30 ... +60
HEES (synth. ester)	-30 ... +80
HEPG (glycol)	-30 ... +40
Mineral greases	-30 ... +110
Running speed	2 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Gliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove side	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %.

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Surface finish of the sliding

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	>0,25 µm	<0,7 µm
R _{v_k}	>0,2 µm	<0,65 µm
R _{v_{kx}}	>0,2 µm	<2,0 µm

The limit values listed in the table do not currently apply for ceramic or semi-ceramic counterfaces.
See also *Merkel Technical Manual*.

Tolerances

Diameter	Tolerance
d ≤ 400	h10
d > 400	-0,4
d1	h10

The tolerance for the diameters d and D2 is specified in connection with the gap dimension calculation.
In typical hydraulic applications up to a nominal dimension of 1,000 mm, the tolerance fields f7 and f8 or H7 and H8 are usually chosen.

Design notes

Please note our general design-related remarks in the *Merkel Technical Manual*.

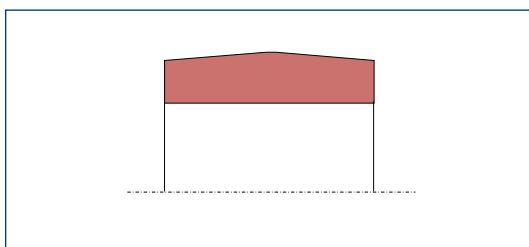

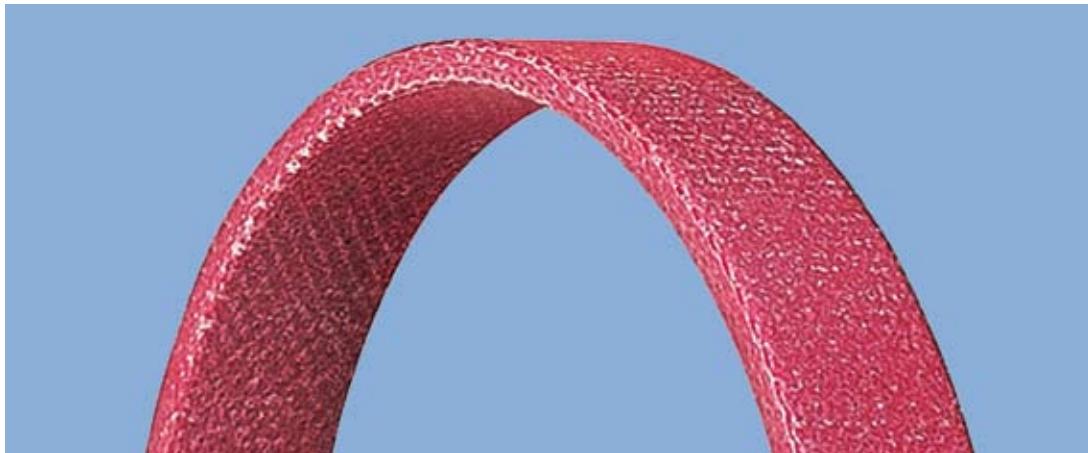

Installation & assembly

Please note our general remarks on hydraulic seal assembly in the *Merkel Technical Manual*

Merkel Guivex SBK Guide Bush

Product description

Profiled rod-type guide bush made of resin bonded fabric. Patented product design (patent No.: PCT/EP95/03874)

Product advantages

Intended, among others, for standardized housings as per ISO 10766

- Can replace current housings of type SB and SF
- High radial load capacity
- Very good guide-length utilization based on uniform stress distribution
- Enhanced penetration of lubricating media based on optimized stress distribution within the contact zone between the guide bush and the counter surface (favorable frictional behavior)
- Reduced propensity for stick-slip
- Excellent sliding behavior over a short guiding distance (no jamming)

Material

Material	Designation	Color
Resin bonded fabric	HGW HG650	red

Applications

- Long-stroke cylinder (piston-rod deflection)
- Short guiding distance (piston-rod tilting)
- Short stroke (inappropriate lubrication)
- Frictionally optimized sealing systems
- Replacement for metallic guides

Operating conditions

Guivex guide bushes can be used in all hydraulic fluids normally found in hydraulic systems such as oils and greases based on mineral oils, water, fire-resistant hydraulic fluids (HFA, HFB, HFC, HFD) and biodegradable hydraulic fluids (HETG, HEES, HEPG).

The maximum permissible operating temperature is 120°C

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50% to max. 90% with cut depth c = Rz/2 and reference line Cref = 0%

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also Merkel Technical Manual. (See section with additional information on surfaces and *Merkel Technical Manual*).

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _{p_k}	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{kx}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not apply, at the present stage, to ceramic or partly ceramic counterfaces.

Tolerances

Diameter D1
H9

Manufacturing tolerances

Profile thickness
-0,01 ... -0,06

The tolerance regarding diameters d and DF is determined in connection with the calculation of the gap dimension. Tolerance zones f7 and f8 and/or H7 and H8 are usually selected for typical hydraulic applications with a nominal size of up to 1,000mm.

Surface load

The value for the specific surface pressure depends on the operating temperature and the scope of elastic deformation (spring deflection) of the guiding element involved. The maximum possible spring deflection in a sealing system is limited by the minimum gap dimension downstream of the primary seal. (See *Merkel Technical Manual*)

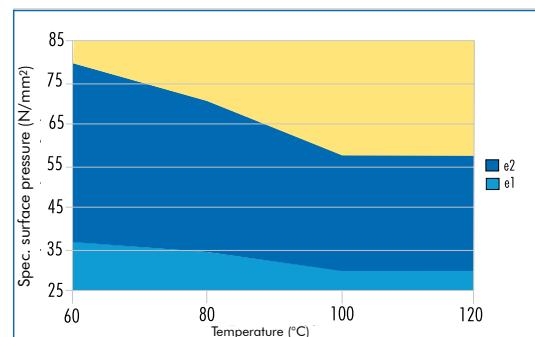

Spring deflection

e1 = 0,1 at s = 2,5

e1 = 0,15 at s = 4

e2 = 0,15 at s = 2,5

e2 = 0,2 at s = 4

Spec. surface pressure under parallel loads

Design notes

Diameter D1 indicated in the article list should be viewed solely in connection with the guide bush. The corresponding diameter of the connected seal housing must be in tune with the sealing element involved.

Please note our general remarks on design in the *Merkel Technical Manual*

Assembly

Please note our general remarks on the assembly of hydraulic seals in the *Merkel Technical Manual*.

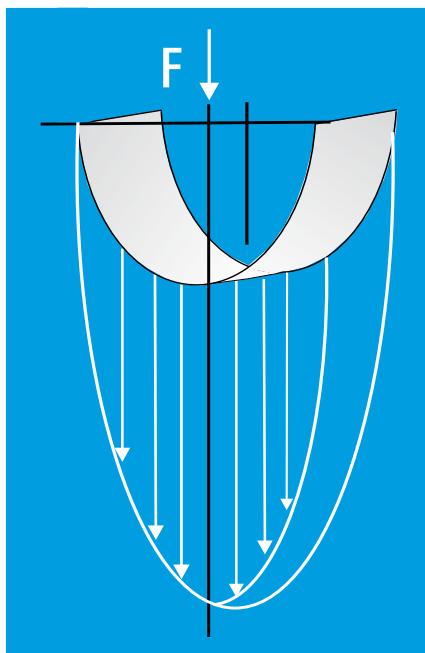

Side load

Side loads within the contact area between the guide and the counterface are not linear. The guiding width required can be calculated by applying the formulas indicated below on the basis of the projected area. The non-linear progression of side

load pressures is taken into account in the contact pressure value.

It may be advisable to reduce the loads by selecting a broader guide in individual cases to obtain an extended service life.

$$F = P \times A$$

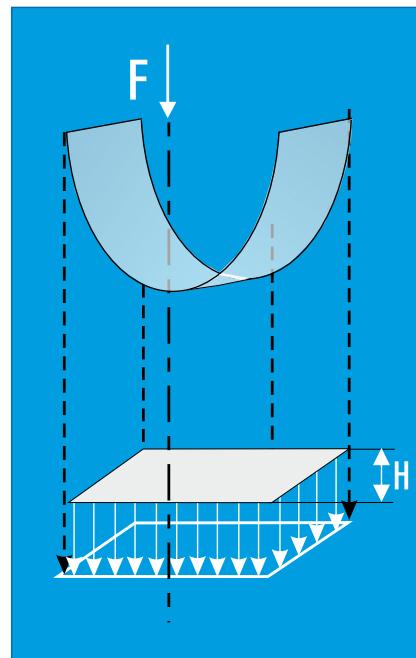

$$A = d \times H$$

$$H = F / (d \times P)$$

H = Guide bandwidth [mm]

F = Radial loads [N]

A = Projected area [mm^2]

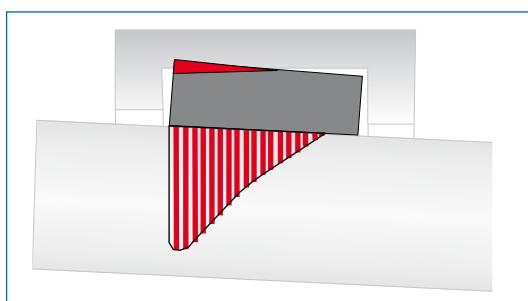

P = perm. surface pressure
[N/mm^2]

d = Rod diameter with rod guide;
Piston diameter with piston
guide [mm]

Operating principle

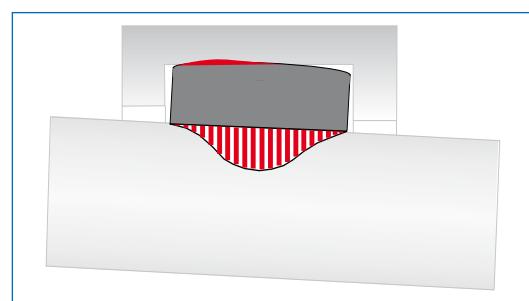

Rectangular guide bushes:

Stress peaks within the edge area

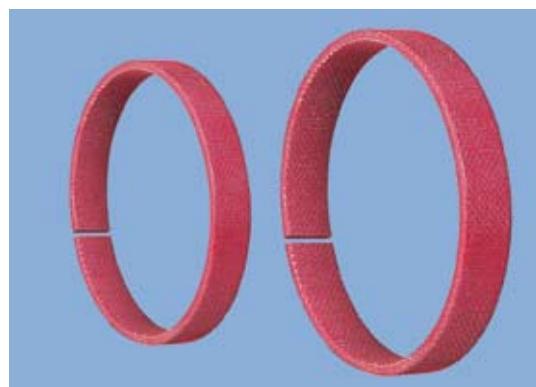

Guivex guide bush:

uniform stress distribution

Additional product description – Guide strips

Side load

The use of guide elements makes it possible to achieve low-friction and low-wear between the moving components of a hydraulic cylinder. Any side loads emerging during operation are absorbed effectively and any metal to metal contact between the piston rod and/or the piston barrel and the surrounding housing components is precluded.

The scope of the maximum side load is essentially determined by the geometrical marginal conditions and the properties of the guide element involved.

Excessive stresses

The guide play and elastic deformation of the elements under load results in an angular deviation between the piston rod and/or the piston barrel and the counterface during operation. Consequently, guides inside hydraulic cylinders will not remain parallel, but primarily stressed at the edges.

In this case, the permissible side load of the guide is defined by the lower maximum load up to edge break and not by the maximum compressive strength of the material. Excessive stresses within the edge area (Figure 01) make the penetration of lubricating media more difficult, too. The hydraulic medium is wiped along the edge stressed on the guide element and the lubricating film is reduced to a minimum, thus leading to stick-slip effects and greater wear.

Profileing

Guivex guide bushes are provided with a convex Profileing oriented towards the groove base. The side load applied is distributed evenly over the width of the guide element here. The maximum contact pressure value remains within the medium range and stress peaks on the edges are reduced (Figure 02).

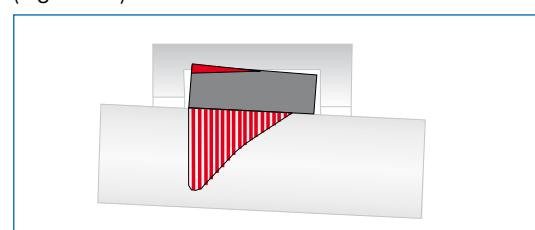

Figure 01: Rectangular guide bush
Excessive stress within the edge area

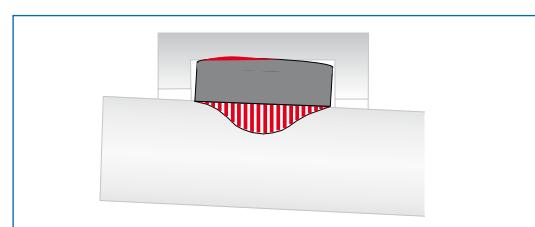

Figure 02: Guivex guide bush
Uniform stress distribution

Sliding properties

Guivex guide bushes made of HGW HG517 and HGW HG 650 materials are compounded with graphite and/or PTFE in order to achieve a better dry-running behavior. As a result, guide bushes made of resin bonded fabric exhibit excellent sliding properties, due to the material properties alone, even in the event of inappropriate lubrication.

The absorption of lubricating media within the area comprised between the guide and the counterface is greatly enhanced by the patented Profileing of Guivex guide bushes. Consequently, the sliding behavior is also improved by the Guivex geometry with correspondingly positive effects in terms of service life and stick-slip behavior.

Radial load capacity

Merkel resin bonded fabric materials are characterized by a high degree of load capacity.

The impact of the operating temperature on the load capacity of resin bonded fabric guide bushes is restricted, of course, when using duroplastic resin bonded fabric quality HGW HG517. The resin matrix of our material HGW HG650 includes both duroplastic and thermoplastic constituents. If permissible side loads are simultaneously less dependent on temperatures, the flexibility will be noticeably improved for assembly with small diameters.

Purely thermoplastic basic materials like polyester, for example, exhibit a temperature-dependent material behavior. Permissible cross loads are greatly reduced under the effect of rising operating temperatures. (See Figure 03).

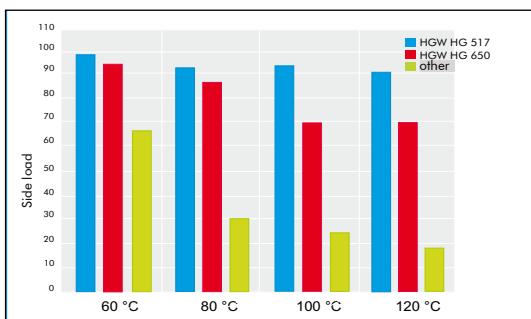

Figure 03: Resin bonded fabric materials in comparison of load capacity among plane-parallel guides depending on the operating temperature involved.

Forces are always introduced within the medium range of the guide bush in conjunction with the patented Guivex geometry. The maximum permissible cross load is not reduced here by excess stress at the edges. Uniform movements along the stroke, coupled with a high radial load capacity, can be achieved even in conjunction with short guide lengths and long-stroke cylinders with high angular offset to be expected.

The absorption of lubricating media within the area comprised between the guide and the counterface is greatly enhanced by the patented Profileing of Guivex guide bushes. Consequently, Guivex guide bushes exhibit a favorable frictional behavior with correspondingly positive effects in terms of service life and stick-slip behavior.

Forces are always introduced within the mid-section of the guide bush. Uniform movements along the stroke, coupled with a high radial load capacity, can be achieved even in conjunction with short guide lengths and long-stroke cylinders with the large angular offset to be expected. The system of guides inside the hydraulic cylinder will not be inclined to jam over a short guide distance either.

The use of Guivex guide bushes makes a vital contribution to the functional reliability and dependability of hydraulic cylinders.

All non-dimensioned edges rounded and burr-free.

Merkel Guide Ring SB

Product description

Non metalic piston guide element

Product advantages

- metal/plastic material combination prevents „seizing“
- high load-bearing capacity, elastic (not plastic) behaviour up to break point
- chamfers Profile edges prevent pressing of edge
- into the corner radii of the housing groove simple snap in fitting ($d < 300$)

Material

Diameter < 300

Material	Designation	Color
Fabric base laminate	HGW HG600	dark grey

Diameter > 300

Material	Designation	Color
Fabric base laminate	HGW HG600	light grey

Application

Nonmetallic guide element for rods, also for standardised housing as per ISO 10766

Field of application

Material	HGW HG517/HGW HG600
Hydraulic oils, HL, HLP	-40° ... +120° C
HFA fluids	+5 ... +60
HFB fluids	+5 ... +60
HFC fluids	-40 ... +60
HFD fluids	-40° ... +120° C
Water	+5 ... +60
HETG (rape-seed oil)	-40° ... +80° C
HEES (synth. ester)	-40° ... +100° C
HEPG (glycol)	-40° ... +80° C
Mineral greases	-40° ... +120° C

For sliding speed, see sealing system.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Material content Mr > 50 % to max. 90 %, with cut depth $c = R_z/2$ and reference line Cref = 0 %

Design notes

Please observe our general design notes in the *Merkel Technical Manual*

Tolerance recommendation

D_1
H8

The tolerance recommendation for dimensions D and d must be regarded in conjunction with the seal being used. The diameter D1 stated in the dimensional table must be seen solely with reference to the guide ring. The corresponding diameter of an adjacent seal installation space must be matched to the sealing element involved.

Manufacturing tolerance

Profile thickness S
-0,02 ... -0,08

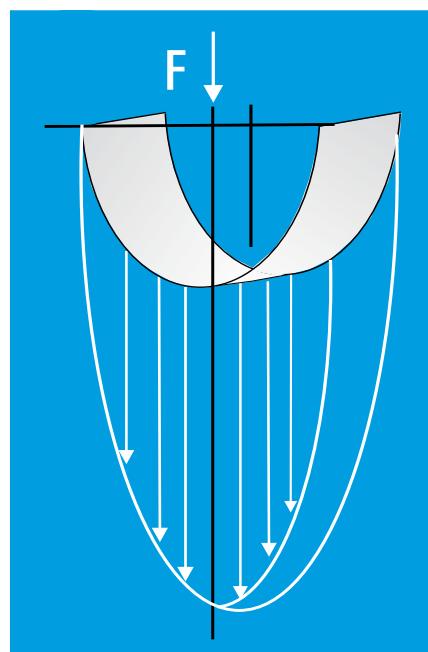

Surface load

Profile thickness S
$p < 50 \text{ N/mm}^2 \dots 60^\circ\text{C}$
$p < 25 \text{ N/mm}^2 \dots 100^\circ\text{C}$

Surface force

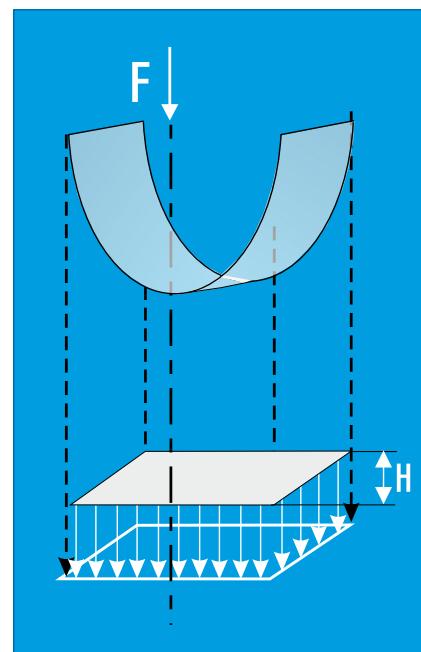

Pressure within the contact area between the guide and the counterface is not linear. The guiding width required can be calculated by applying the formulas mentioned below on the basis of the projected area. The non-linear progression of the contact pressure process is taken into account in the surface pressure value.

It may be advisable to reduce the loads by selecting a broader guide in individual cases to obtain an extended service life.

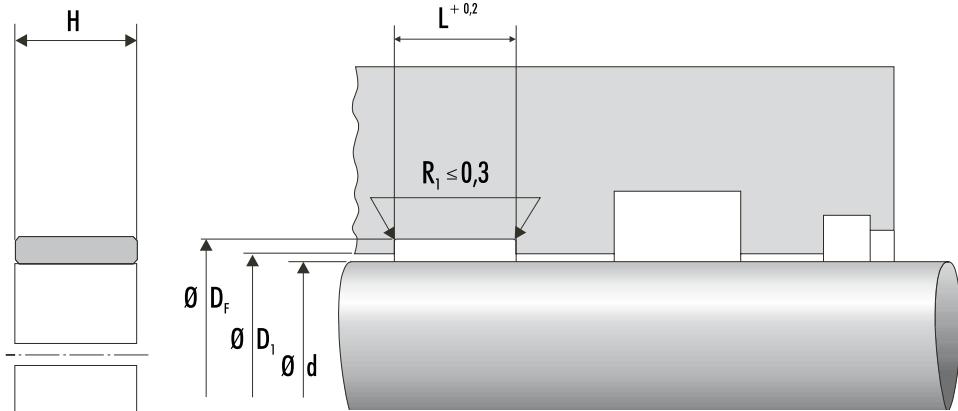

$$\begin{aligned} F &= P \times A \\ A &= d \times H \\ H &= F / (d \times P) \end{aligned}$$

$$\begin{aligned} H &= \text{Guide bandwidth [mm]} \\ F &= \text{Radial loads [N]} \\ A &= \text{Projected area [mm}^2\text{]} \end{aligned}$$

$$\begin{aligned} P &= \text{perm. surface pressure} \\ &\quad [\text{N/mm}^2] \\ d &= \text{Rod diameter with rod guide;} \\ &\quad \text{Piston diameter with piston} \\ &\quad \text{guide [mm]} \end{aligned}$$

All non-dimensioned edges rounded and burr-free.

Merkel SF Guide Ring

Product description

Non-metallic guide ring, either cut to size and ready for installation, or supplied as yard ware.

Product advantages

Non-metallic guide element for rods, for standardized housings as per ISO 10766, too

- low friction, stick-slip-free

Material

Material	Designation	Color
PTFE-bronze compound	PTFE B500	brown

Operating conditions

Merkel SF Guide Ring can be used in all hydraulic fluids normally found in hydraulic systems such as oils and greases based on mineral oils, fire-resistant hydraulic fluids (HFD) and biodegradable hydraulic fluids (HETG, HEES, HEPG). We do not recommend to used Guide Rings SF in water or water based fluids (HFA, HFB, HFC).

The maximum permissible operating temperature is 120 °C

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr >50% to max. 90% with cut depth c = Rz/2 and reference line Cref = 0%

Design notes

Please note our general remarks on design in the *Merkel Technical Manual*.

Manufacturing tolerance

L2	Manufacturing tolerance
>20 ... 80	... 0,5
>80 ... 250	... 1,0
>250 ... 500	... 1,5
>500 ... 1000	... 2,0
>1000 ... 2000	... 3,0
>2000 ... 4000	... 4,0

Recommended tolerancesD₁

H8

The tolerance for dimensions d and D_f must be viewed in connection with the seal used. Diameter D₁ stated in the table of dimensions must be considered exclusively in conjunction with the guide ring. The corresponding diameter of the connected seal housing has to be adapted to the sealing element involved.

Profile thickness

Profile thickness S

-0,05

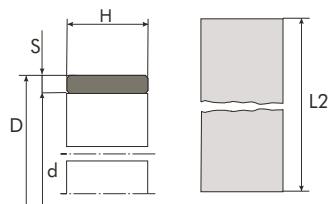

Surface loadp < 15 N/mm² ... 20 °Cp < 7,5 N/mm² ... 80 °Cp < 5 N/mm² ... 120 °C

Sliding speed, see sealing system.

Cutting rolls to size

The dimensions indicated below are available as rolls ware from stock. Stretched length L2 of sections cut to size must be determined in line with the formula of calculation. Gap k arising after assembly is required for thermal expansion purposes. We recommend therefore that the strips be cut straight. Butt joint tips may be damaged by fissures. Our cutter (article N. 507228) makes it possible to cut sections to size in a time-saving and accurate manner.

Calculating stretched length L2 for pistons: L2 = (d + S) x 3,11 - 0,5

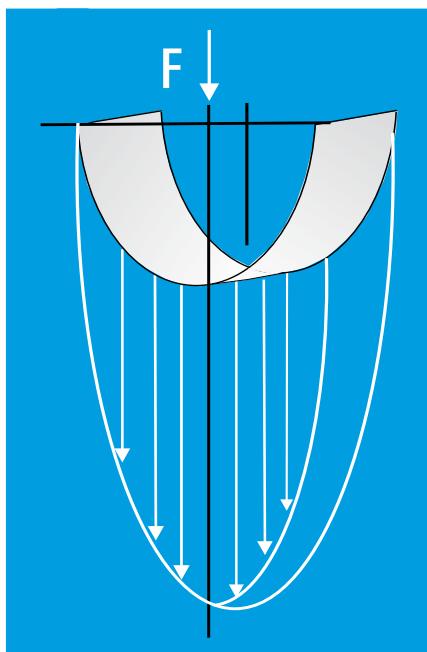

Groove length L	Strip thickness S	Article No.
8	2,5	24226174
9,7	2,5	24102775
10	2,5	24102563

20	4	24238052
25	4	24148093

Surface force

Pressure distribution over guide rings is not linear. The non-linear pressure progression within the contact area has been duly taken into account when determining the permissible specific surface contact pressure value. Permissible loads for guide strips are calculated by multiplying the projected area with the permissible specific surface contact pressure value. However, the angular offset of the piston likely to arise when using the recommended guide elements is duly taken into consideration in the permissible specific surface contact pressure value mentioned here.

$$F = P \times A$$

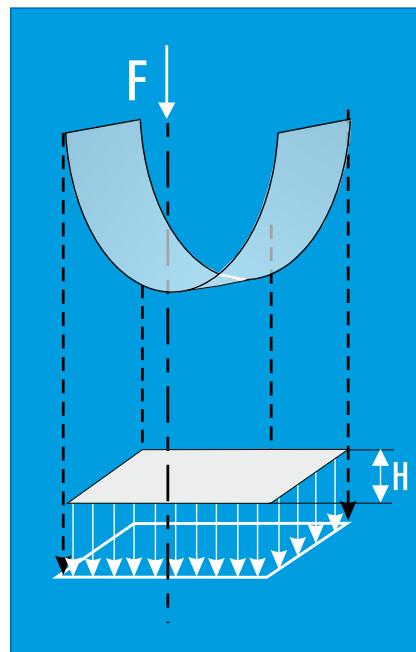

$$A = d \times H$$

$$H = F / (d \times P)$$

H = Guide bandwidth [mm]

F = Radial loads [N]

A = Projected area [mm²]

P = perm. surface pressure

[N/mm²]

d = Rod diameter with rod guide;
Piston diameter with piston
guide [mm]

All non-dimensioned edges rounded and burr-free.

Further dimensions are available on request.

The technical drawing illustrates a cylindrical component with several key dimensions: height H , length L with a tolerance of $+0.2$, a radius $R_1 \leq 0.3$ at the top edge, and diameters $\emptyset D_f$, $\emptyset D_1$, and $\emptyset d$. A note at the bottom states "All non-dimensioned edges rounded and burr-free."

Merkel Guivex KBK Guide Bush

Product description

Profiled piston guide bush made of resin bonded fabric. Patented product design (patent No.: PCT/EP95/03874)

Product advantages

- intended, among others, for standardized housings as per ISO 10766
- interchangeable with current housings of type KB and KF
- high radial load capacity
- very good guide-length utilization based on uniform stress distribution
- enhanced penetration of lubricating media based on optimized stress distribution within the contact zone between the guide bush and the counterface (favorable frictional behavior)
- reduced propensity for stick-slip
- excellent sliding behavior over a short guiding distance (no jamming)

Material

Material	Designation	Color
Resin bonded fabric	HGW HG650	red

Other materials are available on request.

Applications

- Long-stroke cylinder (piston-rod deflection)
- Short guiding distance (piston tilting)
- Short stroke (inappropriate lubrication)
- Frictionally optimized sealing systems
- Replacement for metallic guides

Operating conditions

Guivex guide bushes can be used in all hydraulic fluids normally found in hydraulic systems such as oils and greases based on mineral oils, water, fire-resistant hydraulic fluids (HFA, HFB, HFC, HFD) and biodegradable hydraulic fluids (HETG, HEES, HEPG).

The maximum permissible operating temperature is 120 °C.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr >50% to max. 90% with cut depth $c = R_z/2$ and reference line Cref = 0%

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterface. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the dynamic surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness. See also *Merkel Technical Manual*.

Surface finish of the sliding surfaces

Characteristic value	Limit	
R _a	> 0,05 µm	< 0,30 µm
R _{max}	< 2,5 µm	
R _{p_x}	< 0,5 µm	
R _p	< 0,5 µm	
R _k	> 0,25 µm	< 0,7 µm
R _{v_k}	> 0,2 µm	< 0,65 µm
R _{v_{kx}}	> 0,2 µm	< 2,0 µm

The limit values listed in the table do not apply, at the present stage, to ceramic or partly ceramic counterfaces.

Tolerances

Diameter d ₁
h9

Manufacturing tolerances

Profile thickness
-0,01 ... -0,06

The tolerance regarding diameters d_f and D is determined in connection with the calculation of the gap dimension. Tolerance zones H7 and H8 and/or h7 and h8 are usually selected for typical hydraulic applications with a nominal size of up to 1,000mm.

Surface load

The value for the specific surface pressure depends on the operating temperature and the scope of elastic deformation (spring deflection) of the guiding element involved. The maximum possible spring deflection in a sealing system is limited by the minimum gap dimension downstream of the primary seal. (See also *Merkel Technical Manual*)

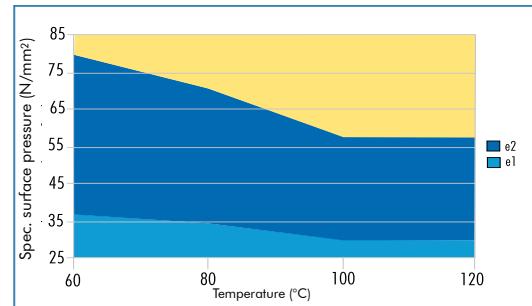

Spring deflection

e1 = 0,1 at s = 2,5

e1 = 0,15 at s = 4

e2 = 0,15 at s = 2,5

e2 = 0,2 at s = 4

Design notes

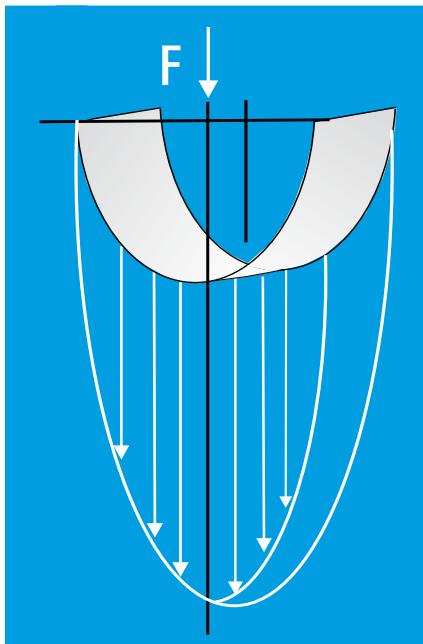

Diameter d₁ indicated in the table of dimensions should be viewed solely in connection with the guide bush. The corresponding diameter of the connected seal housing must be in tune with the sealing element involved.

Installation & assembly

Please note our general remarks on the installation of hydraulic seals in the *Merkel Technical Manual*.

Side load

Pressure within the contact area between the guide and the counterface is not linear. The guiding width required can be calculated by applying the formulas mentioned below on the basis of the projected area. The non-linear progression of the contact pressure process is taken into account in

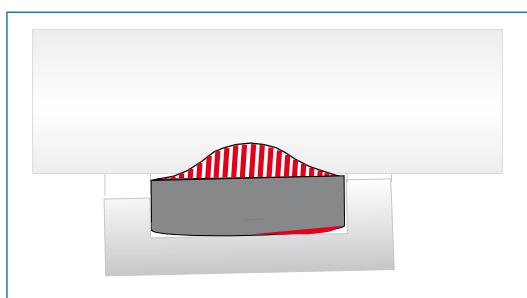

$$\begin{aligned} F &= P \times A \\ A &= d \times H \\ H &= F / (d \times P) \end{aligned}$$

$$\begin{aligned} H &= \text{Guide bandwidth [mm]} \\ F &= \text{Radial loads [N]} \\ A &= \text{Projected area [mm}^2\text{]} \end{aligned}$$

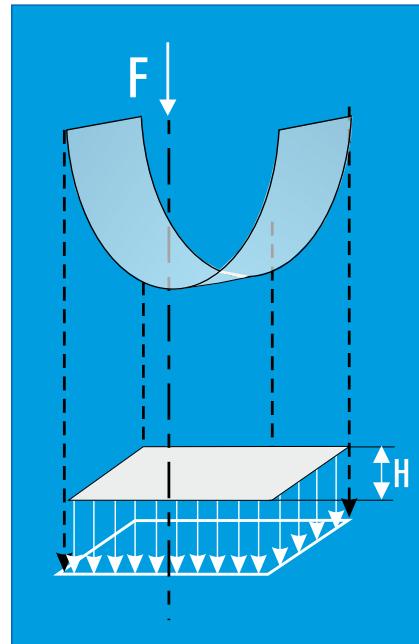

Operating principle

Rectangular guide bushes:
Stress peaks within the edge area

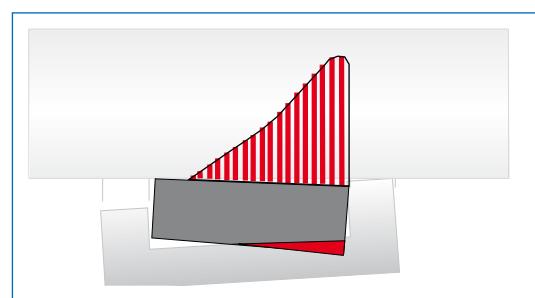

the surface pressure value.

It may be advisable to reduce the loads by selecting a broader guide in individual cases to obtain an extended service life.

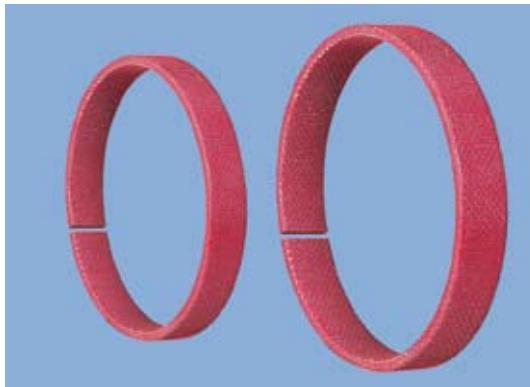

$$\begin{aligned} P &= \text{perm. surface pressure} \\ &\quad [\text{N/mm}^2] \\ d &= \text{Rod diameter with rod guide;} \\ &\quad \text{Piston diameter with piston} \\ &\quad \text{guide [mm]} \end{aligned}$$

Guivex guide bush:
uniform stress distribution

Additional product description – Guide strips

Side load

The use of guide elements makes it possible to achieve a low-friction and low-wear relative motion between the mobile components of the hydraulic cylinder. Any side loads arising during operation are absorbed effectively and any undesirable metal to metal contact between the piston rod and/or the piston barrel and the surrounding housing components is reduced. The scope of the maximum side load is essentially determined by the geometrical marginal conditions and the properties of the guide element involved.

Excessive stresses

The guide play and elastic deformation of the partners under loads result in an angular deviation between the piston rod and/or the piston barrel and the counterface during operation. Consequently, guides inside hydraulic cylinders will not be ideally parallel, but primarily stressed at the edges.

In this case, the permissible side load of the guide is defined by the lower maximum load up to edge break and not by the maximum compressive strength of the material. Excessive stresses within the edge area (Figure 01) make the penetration of lubricating media more difficult, too. The hydraulic medium is wiped along the edge stressed on the guide element and the lubricating film is reduced to a minimum, thus leading to stick-slip effects and more significant wear.

Profileing

Guivex guide bushes are provided with a convex Profileing oriented towards the groove base. The side load applied is distributed evenly over the width of the guide element here. The maximum contact pressure value remains within the medium range and excessive stresses are reduced at the edges (Figure 02).

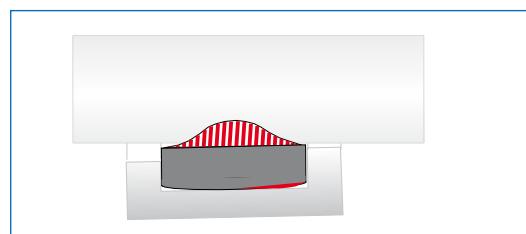

Figure 01: Rectangular guide bush
Excessive stress within the edge area

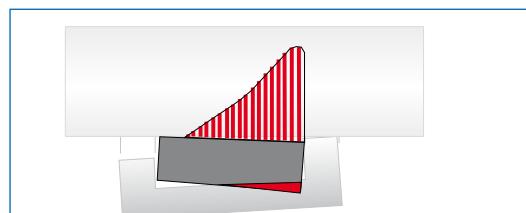

Figure 02: Guivex guide bush
Uniform stress distribution

Sliding properties

Guivex guide bushes made of HGW HG517 and HGW HG 650 materials are compounded with graphite and/or PTFE in order to achieve a better dry-running behavior. As a result, guide bushes made of resin bonded fabric exhibit excellent sliding properties, due to the material properties alone, even in the event of inappropriate lubrication.

The absorption of lubricating media within the area comprised between the guide and the counterface is greatly enhanced by the patented Profileing of Guivex guide bushes. Consequently, the sliding behavior is also improved by the Guivex geometry with correspondingly positive effects in terms of service life and stick-slip behavior.

Radial load capacity

Merkel resin bonded fabric materials are characterized by a high degree of radial load capacity.

The impact of the operating temperature on the load capacity of resin bonded fabric guide bushes is restricted, of course, when using duroplastic resin bonded fabric quality HGW HG517. The resin matrix of our material HGW HG650 includes both duroplastic and thermoplastic constituents. If permissible cross loads are simultaneously less dependent on temperatures, the flexibility will be tangibly enhanced for assembly with small diameters.

Purely thermoplastic basic materials like polyester, for example, exhibit a temperature-dependent material behavior. Permissible cross loads are greatly reduced under the effect of rising operating temperatures. (See Figure 03).

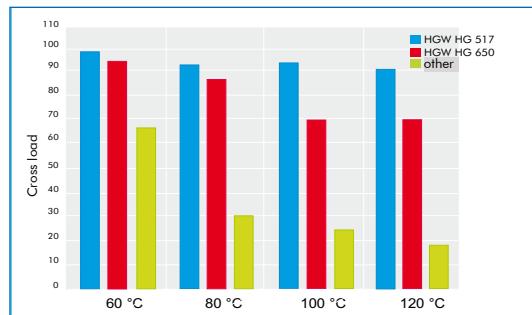

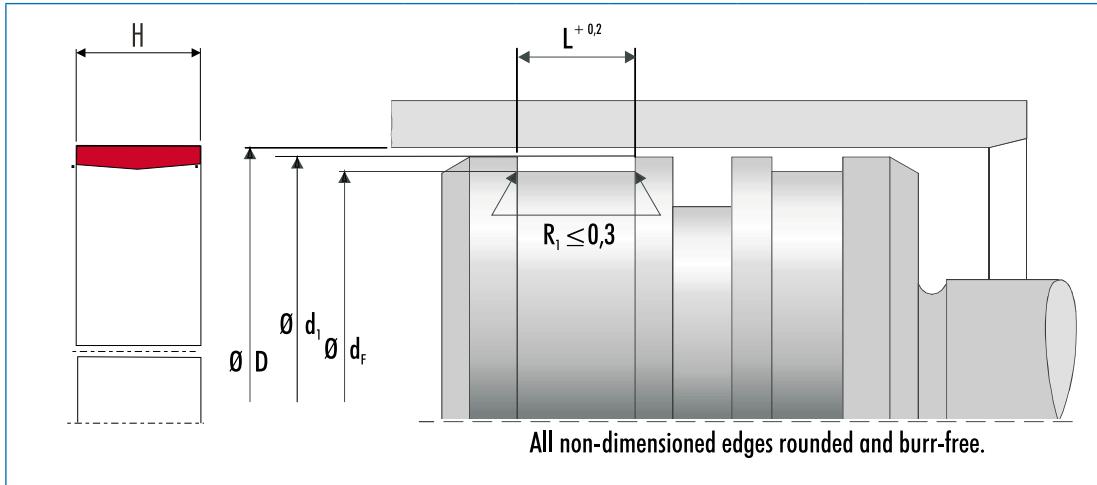

Figure 03: Resin bonded fabric materials in comparison of load capacity among plane-parallel guides depending on the operating temperature involved.

Forces are always introduced within the medium range of the guide bush in conjunction with the patented Guivex geometry. The maximum permissible cross load is not reduced here by excess stresses within the edge area. Uniform movements along the stroke, coupled with a high radial load capacity, can be achieved even in conjunction with short guide lengths and long-stroke cylinders with the large angular offset to be expected.

The absorption of lubricating media within the area comprised between the guide and the counterface is greatly enhanced by the patented Profileing of Guivex guide bushes. Consequently, Guivex guide bushes exhibit a favorable frictional behavior with correspondingly positive effects in terms of service life and stick-slip behavior.

Forces are always introduced within the medium range of the guide bush. Uniform movements along the stroke, coupled with a high radial load capacity, can be achieved even in conjunction with short guide lengths and long-stroke cylinders with the large angular offset to be expected. The system of guides inside the hydraulic cylinder will not be inclined to jam over a short guide distance either.

The use of Guivex guide bushes makes a vital contribution to the functional reliability and dependability of hydraulic cylinders.

Merkel Guide Ring KB

Product description

Non metalic piston guide element

Product advantages

- metal/plastic material combination prevents „seizing“
- high load-bearing capacity, elastic (not plastic) behaviour up to break point
- chamfers Profile edges prevent pressing of edge into the corner radii of the housing groove simple snap in fitting ($d < 300$)

Material

Diameter < 300

Material	Designation	Color
Fabric base laminate	HGW HG600	dark grey

Diameter > 300

Material	Designation	Color
Fabric base laminate	HGW HG600	light grey

Application

Nonmetallic guide element for pistons, also for standardised housing as per ISO 10766

Operating conditions

Material	HGW HG517/HGW HG600
Hydraulic oils, HL, HLP	-40° ... +120° C
HFA fluids	+5 ... +60
HFB fluids	+5 ... +60
HFC fluids	-40 ... +60
HFD fluids	-40° ... +120° C
Water	+5 ... +60
HETG (rape-seed oil)	-40° ... +80° C
HEES (synth. ester)	-40° ... +100° C
HEPG (glycol)	-40° ... +80° C
Mineral greases	-40° ... +120° C

For sliding speed, see sealing system.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 μm	<2,5 μm
Groove base	<1,6 μm	<6,3 μm
Groove sides	<3,0 μm	<15,0 μm

Material content Mr > 50 % to max. 90 %, with cut depth $c = R_z/2$ and reference line Cref = 0 %

Design notes

Please observe our general design notes in the Merkel Technical Manual

Tolerance recommendation

d_1
h8

The tolerance recommendation for dimensions D and d_F must be regarded in conjunction with the seal being used. The diameter d_1 stated in the dimensional table must be seen solely with reference to the guide ring. The corresponding diameter of an adjacent seal installation space must be matched to the sealing element involved.

Manufacturing tolerance

Profile thickness S

-0,02 ... -0,08

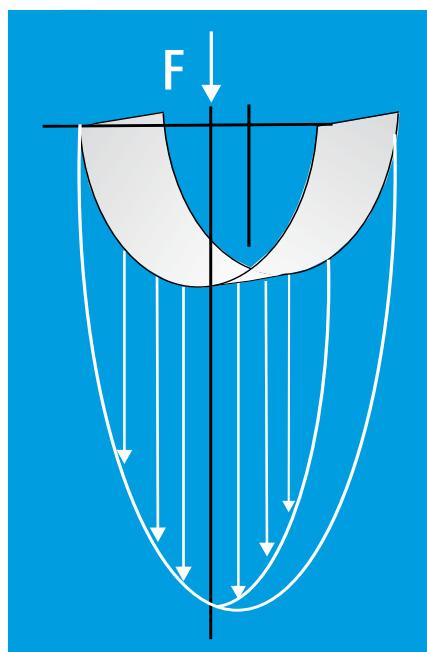

Surface load

Profile thickness S

 $p < 50 \text{ N/mm}^2 \dots 60 \text{ }^\circ\text{C}$ $p < 25 \text{ N/mm}^2 \dots 100 \text{ }^\circ\text{C}$ **Surface force**

Pressure within the contact area between the guide and the counterface is not linear. The guiding width required can be calculated by applying the formulas mentioned below on the basis of the projected area. The non-linear progression of the contact pressure process is taken into account in the surface pressure value.

It may be advisable to reduce the loads by selecting a broader guide in individual cases to obtain an extended service life.

$$F = P \times A$$

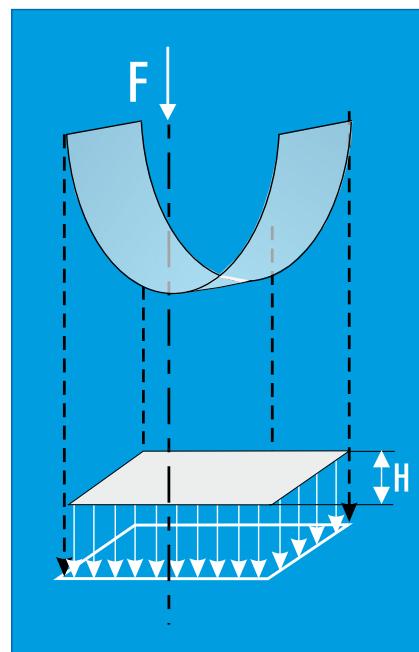

$$A = d \times H$$

$$H = F / (d \times P)$$

H = Guide bandwidth [mm]

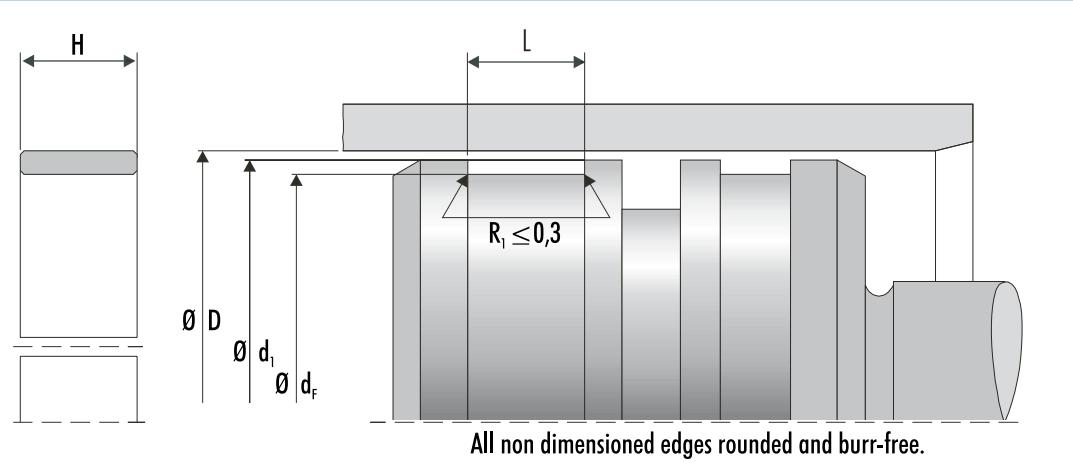

F = Radial loads [N]

A = Projected area [mm^2]

P = perm. surface pressure
[N/mm²]

d = Rod diameter with rod guide;
Piston diameter with piston
guide [mm]

Further dimensions are available on request.

The technical drawing illustrates a housing profile with the following dimensions:

- Width: H
- Outer diameter: $\emptyset D$
- Inner diameter: $\emptyset d_F$
- Depth: d_1
- Length: L
- Radius: $R_1 \leq 0,3$

A note at the bottom of the drawing states: "All non dimensioned edges rounded and burr-free."

Merkel Guide Ring KF

Product description

Non-metallic guide ring, either cut to size and ready for installation, or supplied as rolls.

Product advantages

Non-metallic guide element for pistons, for standardized housings as per ISO 10766, too

- Low friction, stick-slip-free

Material

Material	Designation	Color
PTFE-bronze compound	PTFE B500	brown

Operating conditions

Merkel KF Guide Rings can be used in all hydraulic fluids normally found in hydraulic systems such as oils and greases based on mineral oils, fire-resistant hydraulic fluids (HFD) and biodegradable hydraulic fluids (HETG, HEES, HEPG). We do not recommend to used Guide Rings KF in water or water based fluids (HFA, HFB, HFC).

The maximum permissible operating temperature is 120 °C.

Surface finish

Peak-to-valley heights	R_a	R_{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr >50% to max. 90% with cut depth c = Rz/2 and reference line Cref = 0%

Design notes

Please note our general remarks on design in the *Merkel Technical Manual*.

Manufacturing tolerance

L2	Manufacturing tolerances
>20 ... 80	... 0,5
>80 ... 250	... 1,0
>250 ... 500	... 1,5
>500 ... 1000	... 2,0
>1000 ... 2000	... 3,0
>2000 ... 4000	... 4,0

Recommended tolerances

d_1
h8

The tolerance for dimensions D and d_e must be viewed in connection with the seal used. Diameter d_1 stated in the table of dimensions must be considered exclusively in conjunction with the guide ring. The corresponding diameter of the connected seal housing has to be adapted to the sealing element involved.

Profile thickness

Profile thickness S

-0,05

Surface load

$p < 15 \text{ N/mm}^2 \dots 20^\circ\text{C}$
--

$p < 7,5 \text{ N/mm}^2 \dots 80^\circ\text{C}$

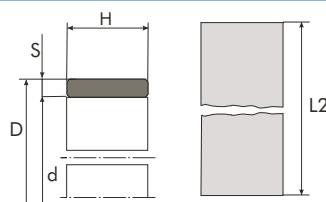

$p < 5 \text{ N/mm}^2 \dots 120^\circ\text{C}$
--

Sliding speed, see sealing system.

Cutting rolls to size

The dimensions indicated below are available as rolls from stock. Stretched length L2 of sections cut to size must be determined in line with the formula of calculation. Gap k arising after assembly is required for thermal expansion purposes. We recommend therefore that the strips be cut straight. Butt joint tips may be damaged by fissures. Our cutter (article N. 507228) makes it possible to cut sections to size in a time-saving and accurate manner.

Calculating stretched length L2 for pistons: $L2 = (D - S) \times 3,11 - 0,5$

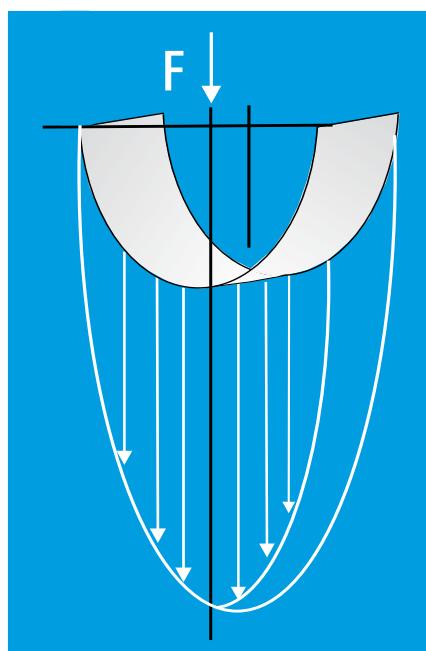

Groove length L	Strip thickness S	Article No.

25	4	24148093

Surface force

Pressure within the contact area between the guide and the counterface is not linear. The guiding width required can be calculated by applying the formulas mentioned below on the basis of the projected area. The non-linear progression of the contact pressure process is taken into account in the surface pressure value.

It may be advisable to reduce the loads by selecting a broader guide in individual cases to obtain an extended service life.

$$F = P \times A$$

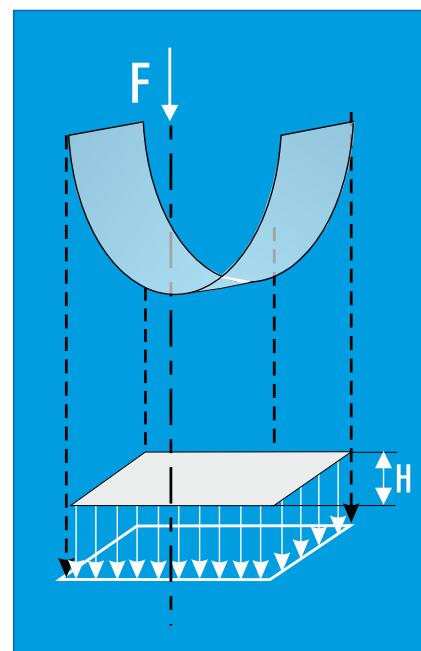

$$A = d \times H$$

$$H = F / (d \times P)$$

H = Guide bandwidth [mm]

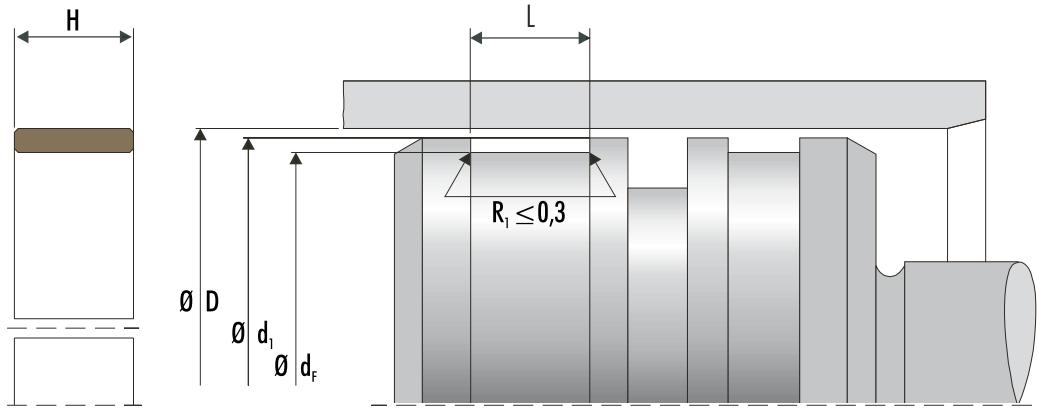

F = Radial loads [N]

A = Projected area [mm^2]

P = perm. surface pressure
[N/mm^2]

d = Rod diameter with rod guide;
Piston diameter with piston
guide [mm]

Further dimensions are available on request.

The diagram shows a cross-section of a housing component. Key dimensions are labeled: H (height), D (width), df (inner width), d_1 (inner height), L (length of the top protrusion), and $R_1 \leq 0,3$ (radius of the top edge). A note at the bottom of the diagram states: "All non-dimensioned edges rounded and burr-free."

Further dimensions are available on request.

The technical drawing illustrates a housing assembly with the following dimensions:

- Housing width: H
- Housing depth: D
- Front housing thickness: d_f
- Front housing height: d_1
- Front housing width: L
- Front housing radius: $R_1 \leq 0,3$

A note at the bottom of the drawing states: "All non-dimensioned edges rounded and burr-free."

Merkel Rotomatic M 15

Product description

Two-piece seal set for sealing piston rods, consisting of a PTFE profile ring and an O-ring as a pre-stress element.

Product advantages

- Quick assembly
- Highly resistant to hydraulic fluids
- Low friction, stick-slip free

Application

Double-action rod seal for pivoting motion in hydraulic plant, preferably for use in hydraulic joints and rotary transmissions.

Material

Profile ring

Material	Designation	Color
PTFE-Glas-MoS ₂ -Compound	GM 201	light grey

O-Ring

Material	Designation	Color
Nitrile rubber	NBR	black

Other material combinations are available on request.

Operating conditions

Material	GM 201/NBR
Hydraulic oils, HL, HLP	-30 ... +100 °C
HFA fluids	+5 ... +60 °C
HFB fluids	+5 ... +60 °C
HFC fluids	-30 ... +60 °C
HFD fluids	-
Water	+5 ... +100 °C
HETG (rape-seed oil)	-30 ... +80 °C
HEES (synth. ester)	-30 ... +80 °C
HEPG (glycol)	-30 ... +60 °C
Mineral greases	-30 ... +100 °C
Pressure	40 MPa
Running speed	0,5 m/s

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sliding surface	0,05 ... 0,3 µm	<2,5 µm
Groove base	<1,6 µm	<6,3 µm
Groove sides	<3,0 µm	<15,0 µm

Material content Mr > 50 % to max. 90 %, with cut depth c = Rz/2 and reference line Cref = 0 %

The long term behavior of a sealing element and its dependability against early failures are crucially influenced by the quality of the counterpart. Therefore a precise description and assessment of the surface is critical.

Based on recent findings, we recommend supplementing the above definition of surface finish for the sliding surface by the characteristics detailed in the table below. With these new characteristics derived from the material content, previous more general descriptions of the material content are significantly improved, especially in regard to surface roughness See also *Merkel Technical Manual*.

Tolerance recommendation

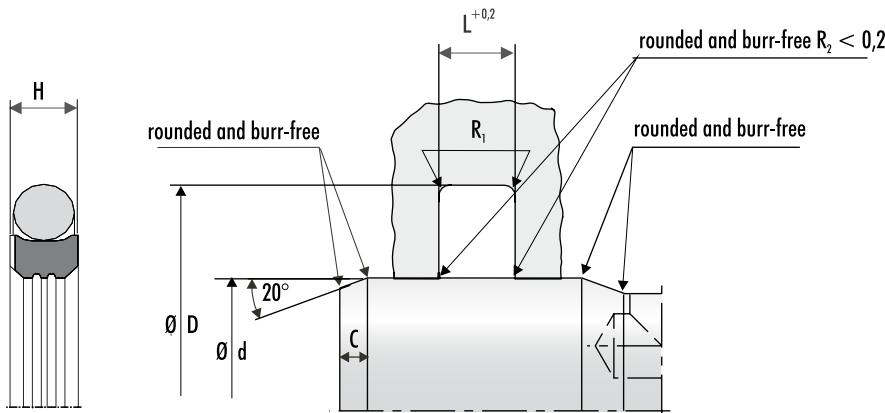

Diameter d	Borehole	Shaft	Groove base
... 500	H9	f8	H9
> 500	H8	f7	H8

Design notes

Please note our general design remarks in the *Merkel Technical Manual*.

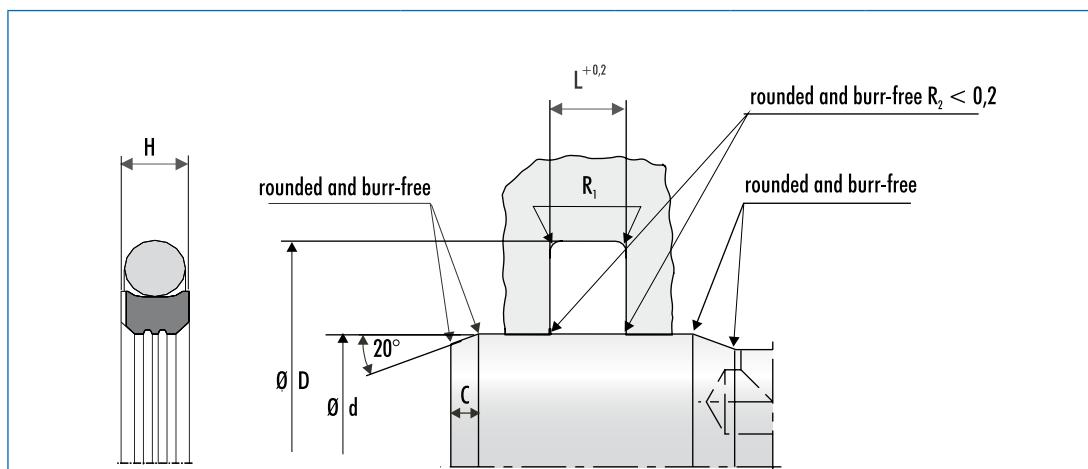

Installation & assembly

Please note our general remarks on hydraulic seal assembly in the *Merkel Technical Manual*.

Other material combinations and further dimensions are available on request.

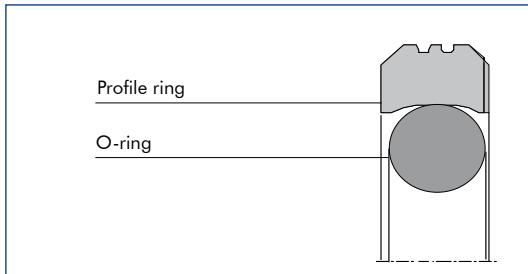

The technical drawing illustrates a seal assembly. The left side shows a cross-sectional view with dimensions: height H, outer diameter Ø D, inner diameter Ø d, and thickness C. The right side shows a top-down view with a stepped profile. Key dimensions include a shoulder height L with a tolerance of $L^{+0,2}$, a radius R₁, and a shoulder radius R₂ described as "rounded and burr-free R₂ < 0,2". A note indicates a 20° angle between the shoulder and the base. The drawing also shows a central bore with a shoulder and a stepped outer profile.

The technical drawing illustrates a seal profile with the following dimensions:

- D:** Total width of the seal.
- d:** Width of the central recessed area.
- R1:** Radius of the corner where the seal meets the base.
- L:** Length of the seal.
- C:** Width of the shoulder at the top.
- H:** Height of the shoulder at the top.
- Profile:** A cross-sectional view showing the seal's thickness and internal features.
- rounded and burr-free:** Labels indicating the top and bottom edges are rounded and free of burrs.
- 20°:** An angle measurement indicated on the drawing.
- $\varnothing D$** : Diameter of the outer profile.

Merkel Cover Seal PU 82

Product description

Single-piece, double-acting compact seal made of polyurethane for static sealing, internal sealing.

Product advantages

- Interchangeable with housings for O-ring and O-ring with back-up ring
- High degree of functional reliability provided by the sturdy Profile ring made of polyurethane
- Great resistance to extrusion (dimensional stability)
- Simple and safe assembly (single-piece element)
- Simplified inventory
- Gastight

Material

Material	Designation	Color
Polyurethane	95 AU V142	dark blue
Polyurethane	94 AU 925	light blue

The material is determined on the basis of the nominal diameter and the manufacturing process.

Applications

- High operating pressure (up to 60 MPa)
- Breathing gap (cylinder expansion)
- Short pressure build-up time (end-of-travel damping)
- Reciprocal operating pressure
- Nominal diameter up to 2,000mm

Operating conditions

Material	95 AU V142/94 AU 925
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +40 °C

Additional product description – Cover Seal PU 82

O-ring and back-up ring

Static sealing is usually achieved by combining an O-ring and a back-up ring for operation at a pressure exceeding 15 MPa and for pressurization on one side. At higher operating pressures, the back-up ring function is restricted by the resulting tube expansion. This causes damage to the O-ring as well as the back-up ring, as a result of gap extrusion.

Two back-up rings are required in the event of alternate pressurization. Under such operating conditions, O-rings are frequently twisted inside the groove until the sealing element fails. A series of possible defects likely to jeopardize the lasting functionality of the sealing element also arise during installation and operation of the combined O-ring and back-up ring.

Cylinder expansion

A conventional back-up ring fills the gap to the main functional surface in pressureless condition. Back-up rings are made either of virgin PTFE or more dimensionally stable materials like PA, for example. Pure PTFE tends to creep under the effects of lengthy stresses. The back-up ring adapts itself to the housing, while filling the gap. At high pressure, the surfaces to be sealed are moved as a result of cylinder expansion. The PTFE back-up ring penetrates into the sealing gap and is squeezed when relieved (Figure 01). Dimensionally stable PA back-up rings are only slightly distorted under pressure and fail, therefore, to adapt their shape to the housing. The O-ring may penetrate

into the sealing gap arising under pressure. If the pressure drops suddenly, the extrusion lug may be sheared off as a result. In this case, the elastic deformation of the metal (cylinder expansion) is reduced within a shorter period of time than that required by the O-ring to get out of the gap. The gap resulting from the manufacturing tolerances of the back-up ring on the side facing the groove bottom represents a further source of defects in terms of damage caused by extrusion to the O-ring (Figure 02). The cover seal is subject to comparatively moderate deformations only at high operating pressures (Figure 03). The element bridges the extrusion gap, but does not penetrate into it. The deformation is entirely reversible.

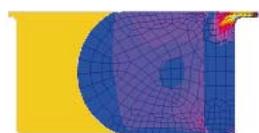

Figure 01: PTFE back-up ring at 40 MPa

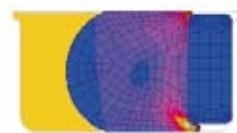

Figure 02: PA back-up ring at 20 MPa

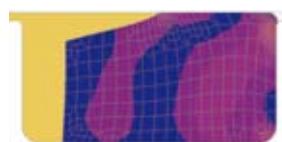

Figure 03: Cover seal at 40 MPa

Pressure

The radial deformation of the sealing element inside the housing is an indicator for the sealing effect. Whereas insufficient pressure reduces both the initial sealing effect in pressureless condition and the suitability for short pressure build-up periods, excessive pressure may lead to a shorter service life as a result of material fatigue.

The tolerances for metallic components and the seal exert a profound influence on Profile overlapping. Whereas tolerance dimensions for metallic components are selected according to the nominal diameter involved, the cord thickness for an O-ring is given a constant tolerance regardless of the O-ring diameter. The larger the nominal diameter with the same cord thickness, the larger possible deviations from ideal pressure conditions will be. The sealing effect and/or the functional reliability of an O-ring will decline in proportion to nominal diameter increases.

The cover seal Profile is adapted to the housing respectively involved, i.e. by taking the nominal diameter into consideration, too, on the basis of a design program and in view of the pressing conditions. Consequently, the diameter has no impact on the sealing effect and functional reliability.

The cover seal is designed individually in line with the metallic housing used. A continuously high degree of functional reliability is set regardless of the tolerances of the metallic components and of the nominal diameter involved. It is possible to apply application experiences gathered with one scope of diameters directly to another scope of diameters, when designing series.

A high degree of functional reliability is attained under any operating conditions due to a great resistance to extrusion and a favorable mold release behavior, on the one hand, and to the high line force around the sealing edge even in pressureless condition, on the other.

The Profile ring of the cover seal is clearly preferred due to the stable support provided in the groove bottom. Any squeezing and rotary movements occurring inside the sealing ring under changing pressure as well as a helical distortion of the sealing ring during assembly are precluded, thus providing enhanced functional reliability.

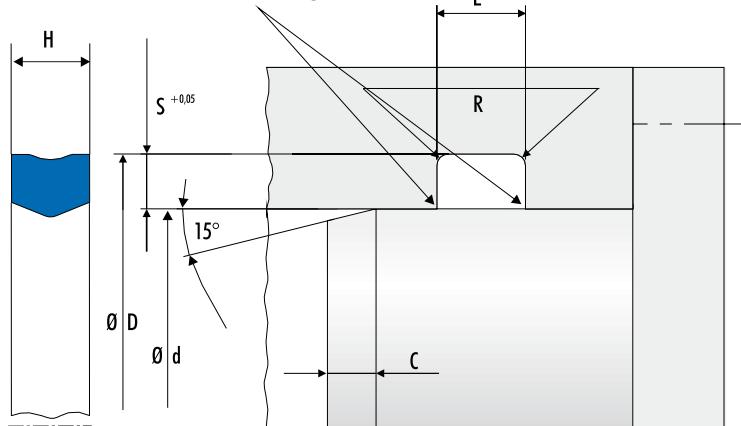

The single-piece symmetrical cover seal design precludes any faulty installation due to twisting or confusion.

Procurement and storing are simplified by the use of the single-piece cover seal.

The use of the cover seal makes a vital contribution to the functional reliability and dependability of hydraulic cylinders.

Merkel Stircomatic SRC

Product description

Single-piece compact seal made of polyurethane for static sealing, axially sealing component.

Product advantages

- Interchangeable with housings for O-ring and O-ring with back-up ring
- Firm seat inside the housing provided by optimally designed sealing edges (stress distribution)
- High degree of functional reliability provided by the sturdy Profile ring made of polyurethane
- Functional reliability resulting from a great resistance to extrusion (dimensional stability)
- Simple and safe assembly
- Gastight

Material

Material	Designation	Color
Polyurethane	95 AU V142	dark blue
Polyurethane	94 AU 925	light blue

The material is determined on the basis of the nominal diameter and the manufacturing process.

Applications

- Negative pressure (flowing medium)
- Pulsating pressure
- High operating pressure (up to 80 MPa)
- Nominal diameter up to 2,000mm

Operating conditions

Material	95 AU V142/94 AU 925
Hydraulic oils, HL, HLP	-30 ... +110 °C
HFA fluids	+5 ... +50 °C
HFB fluids	+5 ... +50 °C
HFC fluids	-30 ... +40 °C
HFD fluids	-
Water	+5 ... +40 °C
HETG (rape-seed oil)	-30 ... +60 °C
HEES (synth. ester)	-30 ... +60 °C
HEPG (glycol)	-30 ... +40 °C
Mineral greases	-30 ... +110 °C
Pressure	80 MPa

The figures given are maximum values and must not be applied simultaneously.

Surface finish

Peak-to-valley heights	R _a	R _{max}
Sealing surfaces	<1,6 µm	<6,3 µm
Groove sides	<6,3 µm	<20 µm

More accurate values for Ra and Rmax should be set within the sealing surfaces for applications requiring gastight operation.

Tolerances

Diameter	Tolerance
d	h10
D	H9

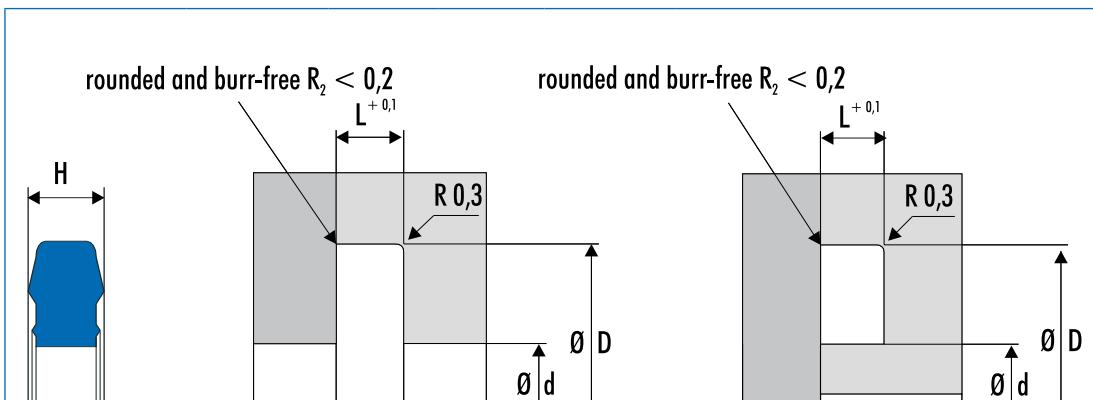

Design notes

The housing for the Stircomatic SRC may be designed with an aperture in inner diameter direction or in the form of an axial recess. Pressure is applied from the interior.

Please note our general remarks on design in the *Merkel Technical Manual*.

Installation & assembly

Please note our general remarks on the installation of hydraulic seals in the *Merkel Technical Manual*.

All non-dimensioned edges rounded and burr-free.

O-Rings

Applications

O-rings are mainly used to seal stationary machine components - static seals - against fluid and gaseous media. In certain conditions, they can also be used as a dynamic sealing component for axial, rotating and oscillating movement.

Surface finish

Surface roughness	R_a	R_{max}
Sealing surface	<1,6 µm	<6,3 µm
Groove base	<1,6 µm	<6,3 µm
Sides of groove	<6,3 µm	<10,0 µm
Lead-in chamfer	<0,6 µm	<5,0 µm

Product description

O-rings are multi-purpose seals which are mainly used as static sealing elements.

Product advantages

O-rings suffer permanent deformation (compression set). Since O-rings with a small cord diameter (diameter d2) have a relatively high compression set, use of O-rings with the largest possible cord diameter is to be recommended. The table shows the recommended cord diameter

Material

In order to cover the widest possible range of technical applications, O-rings are supplied in various different material qualities.

Recommended cord diameters

$\varnothing d / \varnothing D$	Cord diameters															
	1,5	1,78	2	2,5	2,62	3	3,5 - 3,53	4	5	5,33	6	6,99 - 7,0	8	8,4	10	13

>500											+	+	+	x	x	x

x recommended dimension + other usable dimension

The t and b housing dimensions depend on the O-ring cord diameter d2. If anti-extrusion rings are used, dimension b should be increased accordingly.

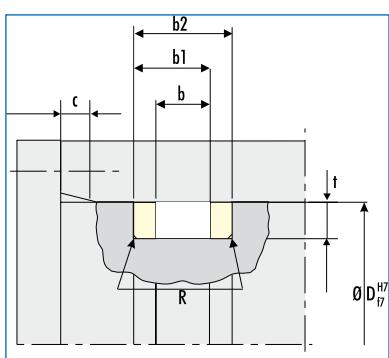

Ø d	Type of installation 1 or 2				Type of installation 3		R	c

Sectoral solutions

Merkel Freudenberg Fluidtechnic aspires to develop and produce seals and to offer them with comprehensive service in order to fulfill current customer requirements to the greatest extent possible.

In order to live up to this aspiration Merkel has specialised in providing seals and sealing systems for heavy industry. The individual components are optimally matched to each other in terms of material and functionality,

as all individual seals are also developed as integral solutions. Long service lives and high media resistance are ensured by a choice of material and profile design selected to suit the respective industry.

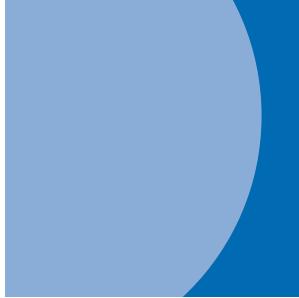

Merkel seals and sealing systems in the steel and non-ferrous metal industry:

the longest service lives, even under the toughest environmental conditions

Merkel seals and sealing systems in the plastics processing industry:

high dependability, even with more than 2.5 million load alternations per year

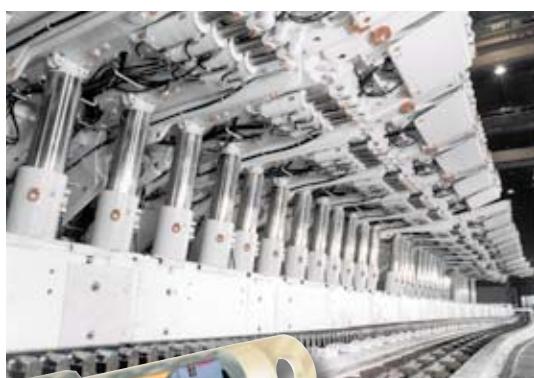

Merkel seals and sealing systems in the paper manufacture:

high dependability under high speeds and abrasive media

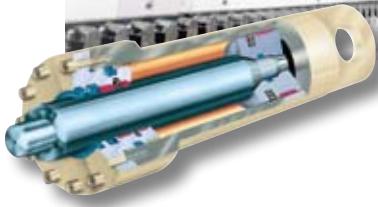

Merkel seals and sealing systems in steel hydraulics engineering or shipbuilding:

high dependability, even with long maintenance intervals

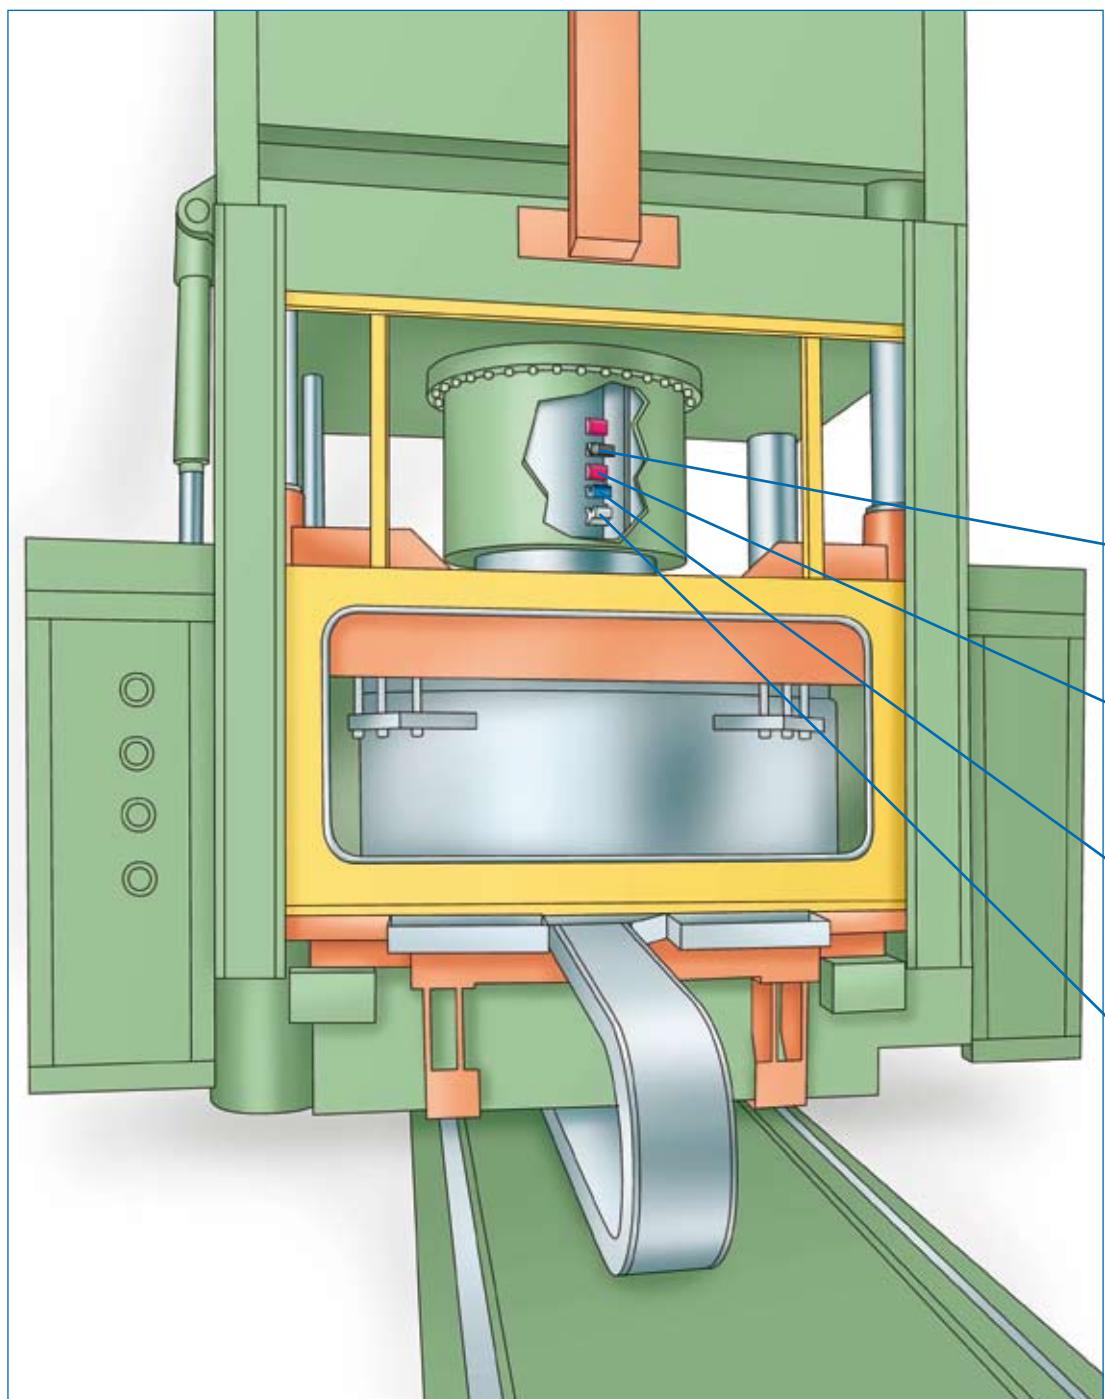

Merkel seals and sealing systems in special machine-building:

high reliability under extreme demands and harsh environmental influences

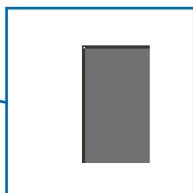

Merkel Sealing Systems for Large Size Presses

Germany's largest vacuum chamber press is reliably performing at Merkel Freudenberg Fluidtechnic in Hamburg. Merkel as the operator is simultaneously also the supplier of the sealing system needed to run the main cylinder of this press. The sealing system perfectly matches with the special re-

quirements involved: long-term and stable holding of the high working pressure, and standing against high temperatures due to the vulcanization process involved. The Merkel sealing system ideally offers an optimum regarding sealing function and lifetime.

The field-proven Merkel rod sealing system for highest functional reliability.

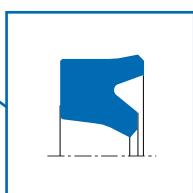

Merkel Omegat OMS-S

- Very high stability under pressure
- Low friction, stick-slip free
- High torsional safety

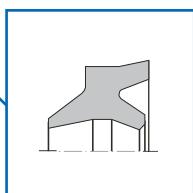

Merkel Guide Bushes Guivex SBK

- Excellent sliding behavior over a short guiding distance (no jamming)
- High radial load capacity
- Reduced propensity for stick-slip

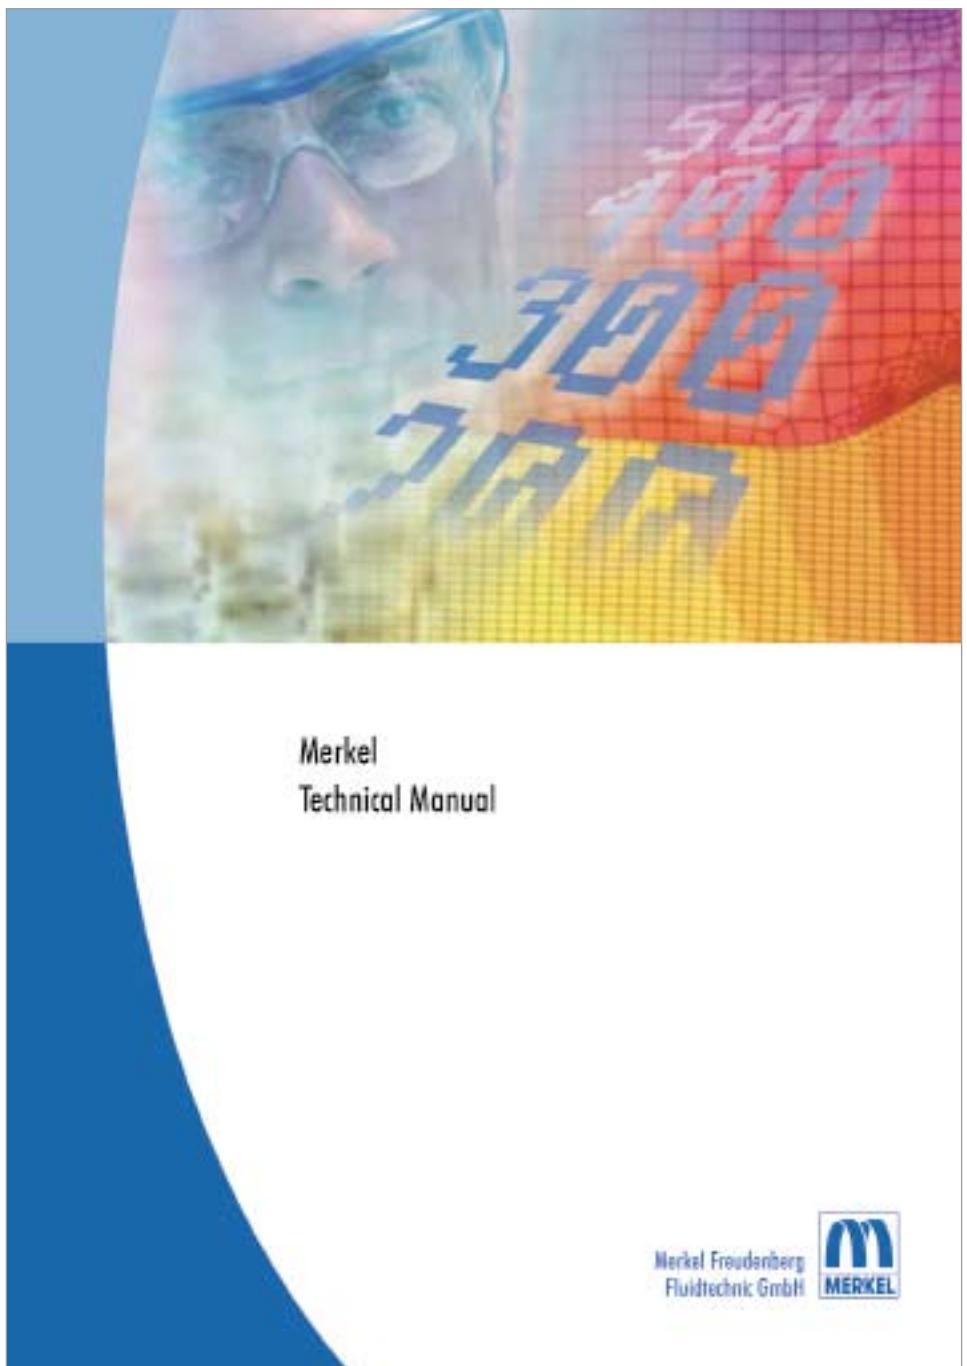

Merkel Polyurethane U-Ring T 20

- Wide operating temperature range
- Dynamic deformation value
- Very good static and dynamic tightness

Merkel Double Wiper P 9

- Wear resistant
- high wiper effect against dirt
- very good sealing effect against residual oil film on

Merkel Technical Manual

The Merkel Technical Manual includes data and descriptions regarding technical fundamental principles, sealing mechanisms and factors of influence, materials and resistance values as well as the installation of hydraulic seals. Please order with No.: 15 DE MHI.

Merkel Freudenberg
Fluidtechnic GmbH 

Merkel - by your side around the globe

Merkel Quality & Value

Boost your success with our sealing expertise:

- Perfect sealing technology for top productivity
- Leading material know-how
- Extrusion-proof products with a long service life and extended service intervals
- Absolute functional reliability of the seals under the most diversified and extremely stringent conditions
- Experience gathered in sealing technology since 1899

Merkel Service

Take advantage of our excellent services worldwide:

- 120,000 widely diversified products
- Very high degree of availability, prompt worldwide supplies
- Built-to-order; rapid, tailor-made, economical
- Optimum solutions for challenging special applications
- Individual test series under genuine conditions
- Immediate assistance in the event of repairs
