## Hydraulic seals linear

## Inch Version

Your Partner for Sealing Technology

## Your Partner for Sealing Technology

Trelleborg Sealing Solutions is a major international sealing force, uniquely placed to offer dedicated design and development from our market-leading product and material portfolio: a one-stop-shop providing the best in elastomer, thermoplastic, PTFE and composite technologies for applications in aerospace, industrial and automotive industries.

With 50 years experience, Trelleborg Sealing Solutions engineers support customers with design, prototyping, production, test and installation using state-of-the-art design tools. An international network of over 70 facilities worldwide includes 30 manufacturing sites and strategically positioned research and development centers, including materials and development laboratories and locations specializing in design and applications.

Developing and formulating materials in-house, we utilize the resource of our material database, including over 2,000 proprietary compounds and a range of unique products.

Trelleborg Sealing Solutions fulfills challenging service requirements, supplying standard parts in volume or a single custom-manufactured component, through our integrated logistical support, which effectively delivers over 40,000 sealing products to customers worldwide.

Facilities are certified to ISO 9001:2000 and ISO/TS 16949:2002, with many manufacturing sites also working to QS9000 and VDA 6.1. Trelleborg Sealing Solutions is backed by the experiences and resources of one of the world's foremost experts in polymer technology: Trelleborg AB.

The information in this brochure is intended to be for general reference purposes only and is not intended to be a specific recommendation for any individual application. The application limits for pressure, temperature, speed and media given are maximum values determined in laboratory conditions. In application, due to the interaction of operating parameters, maximum values may not be achieved. It is vital therefore, that customers satisfy themselves as to the suitability of product and material for each of their individual applications. Any reliance on information is therefore at the user's own risk. In no event will Trelleborg Sealing Solutions be liable for any loss, damage, claim or expense directly or indirectly arising or resulting from the use of any information provided in this brochure. While every effort is made to ensure the accuracy of information contained herewith, Trelleborg Sealing Solutions cannot warrant the accuracy or completeness of information.

To obtain the best recommendation for a specific application, please contact your local Trelleborg Sealing Solutions marketing company.

This edition supercedes all previous brochures.

## - Choice of the Sealing Element

Sealing elements have a decisive influence on the design, function and service life of hydraulic and pneumatic cylinders and systems.

This applies equally to the piston rod seals where leak tightness, resistance to wear and gap extrusion, resistance to process media, resistance to high and low temperatures, low friction, compact form and simple installation are demanded in order to meet the requirements of industry for a functional sealing solution.

The significance of these parameters and their limits generally depends on the requirements of the specific application. Trelleborg Sealing Solutions has therefore developed a complete range of seals which, due to their optimized geometries and designs and the use of highquality materials such as Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$, satisfy the technical and economic demands of the industry in full.

In order to be in a position to select the most appropriate seal type and material, it is necessary to first define all the desired functional parameters. Table I can then be used to make an initial selection of seals and materials according to the specific requirements of the application.

The second column of the table contains the number of the page on which further general information together with specific design and installation instructions on the particular seal type and materials (or material combinations with multi-element seals, e.g. Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 K$ ) can be found.

Furthermore on page 10, attention is drawn to the quality of the mating surface. We recommend that the limits specified there be observed, as they have a decisive influence on the functionality and service life of the system.

The final choice of seal type and material must also take into account detailed information on the seal elements.

Please do not hesitate to contact our Technical Department for further information on specific applications and special technical questions.

This catalog is a compilation of the preferred product ranges of Trelleborg Sealing Solutions. All similar products are technically equivalent but availability and pricing may vary. For further information please contact your local Trelleborg Sealing Solutions sales office.

## Note on Ordering

All multi-element standard rod seals, e.g. Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR}$ 2 K , are generally supplied as complete seal sets. The supply includes the seal and matching elastomer energizing elements. The O-Ring does not have to be ordered separately. It is also possible to use other O-Ring materials from our O-Ring catalog.
Older designs of seals no longer contained in this catalog naturally continue to be available (see chapter Non Standard Seals). For all new applications, however, we recommend the use of the seal types and preferred sizes (ISO series, wherever possible) listed in this catalog.
Other combinations of materials and special designs can be developed and supplied for special applications in all intermediate sizes up to 102 inches ( 2.600 mm ) diameter, provided there is sufficient demand.

The sizes contained in this catalog are mostly available from stock or can be supplied at short notice. We reserve the right to modify our supply program.

## Redundant Sealing System

Sealing of environmentally harmful fluids has led Trelleborg Sealing Solutions to develop innovative sealing systems to meet the ever demanding industry specifications with regard to leak-free performance and high service life.
In heavy duty applications, leak free performance and high service life cannot be assured by a single sealing element; therefore, specially developed system seals are arranged in series, building a tandem arrangement.
Each sealing element in a system has its specific function and their interaction needs to be secured to get a redundant sealing system.
The primary seal in PTFE based proprietary Turcon ${ }^{\circledR}$ material generates low friction and has excellent wear and extrusion resistance under extreme working conditions. It allows a fine lubrication film passing this first barrier, ensuring the necessary lubrication of the secondary sealing element for long service life.

The tandem arrangement requires an outstanding backpumping ability of the primary seal and the secondary seal, if a double acting scraper is installed. A combination of
different sealing materials in a system, Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$, (PTFE and Polyurethane) ensures the best sealing performance.

Trelleborg Sealing Solutions has pioneered work in this area and continues development of redundant sealing today.

Outstanding solutions to such applications have been the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ in tandem arrangement. A tandem sealing system can also be created by using e.g. Zurcon ${ }^{\circledR}$ Rimseal, Zurcon ${ }^{\circledR}$ U-Cup RU9 or U-Cup as secondary sealing elements. Depending on type of secondary seal, a single- or double acting scraper completes the system, to offer the highest possible operation reliability, ensuring both adequate lubrication of the sealing system and a long service life.

Figure 1 shows an example of a redundant sealing system consisting of Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$, Zurcon ${ }^{\circledR}$ Rimseal and Rod Scraper DA 22 with corresponding wear ring arrangement.

Figure 1 Example of a Redundant Modular Sealing System

## Rod Seals

## Design Instructions

## Lead-in Chamfers

In order to avoid damage to the rod seal during installation, lead-in chamfers and rounded edges must be provided on the piston rods (see Figure 2). If this is not possible for design reasons, a separate installation tool must be used.

The minimum length of the lead-in chamfer depends on the profile size of the seal and can be seen from the following tables.
Generally $\Delta d_{N}$ min. from Table II is recommended but $\Delta d_{N}$ must also exceed $0.015 \times$ rod diameter $d_{N}$ (relevant for big diameter rods).

Table II Elastomer Energized**

| Lead-in Chamfer <br> Diameter reduction <br> $\Delta \mathbf{d}$ min. | Groove Width <br> $\mathbf{L}_{\mathbf{1}}{ }^{*}$ |
| :---: | :---: |

* Though not less than $1.5 \%$ of service diameter (bore/rod diameter).
** The O-Ring cross section $\mathrm{d}_{2}$ can be found in the appropriate table "Installation Dimensions", from chapter Double Delta ${ }^{\circledR}$.

Figure 2 Lead-in chamfers

## Distance between Grooves

When installing tandem seal arrangement or double-acting scraper seals in conjunction with rod seals with back pumping effects such as Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ and Zurcon ${ }^{\circledR}$ Rimseal, we recommend the following arrangement:

- Distance between seal grooves and/or scraper seal groove $\mathrm{L}=$ at least groove depth X
- Oil reservoir for collecting the returning oil as shown in Figure 3.

Figure 3 Recommendation for groove spacings between grooves

## Surface Roughness DIN EN ISO 4287

The functional reliability and service life of a seal depend to a very great extent on the quality and surface finish of the mating surface to be sealed.

Scores, scratches, pores and concentric or spiral machining marks are not permitted. Higher demands must be made on the surface finish of dynamic surfaces than of static mating surfaces.

The characteristics most frequently used to describe the surface microfinish $R_{a}, R_{z}$ and $R_{\text {max }}$ are defined in DIN EN ISO 4287. These characterics alone, however, are not sufficient for assessing the suitability in seal technology. In addition, the material contact area of the surface roughness profile $\mathrm{R}_{\mathrm{mr}}$ in accordance with DIN EN ISO 4287 should be demanded. The significance of this surface specification is illustrated in Fig. 4. It shows clearly that specification of $R_{a}$ and $R_{z}$ alone do not describe the surface roughness profile accurately enough for the seal technology and is thus not sufficient for assessing the suitability. The material contact area $\mathrm{R}_{\mathrm{mr}}$ is essential for assessing surfaces, as this parameter is determined by the specific surface roughness profile. This in turn is directly dependent on the machining process employed.

Trelleborg Sealing Solutions recommends that the following surface finishes be observed:

Table V Surface Roughness

| Surface Roughness $\mu$ inch |  |  |  |
| :--- | :---: | :---: | :---: |
| Parameter | Mating Surface |  | Groove |
|  |  |  |  |
|  | Turcon <br> Materials | Zurcon ${ }^{\circledR}$ <br> and Rubber | $<625$ |
| $\mathrm{R}_{\max }$ | $25-100$ | $40-160$ | $<400$ |
| $\mathrm{R}_{\text {zDIN }}$ | $16-63$ | $25-100$ | $<63$ |
| $\mathrm{R}_{\mathrm{a}}$ | $2-8$ | $4-16$ | $<$ |

The material contact area $\mathrm{R}_{\mathrm{mr}}$ should be approx. 50 to $70 \%$, determined at a cut depth $\mathrm{c}=0.25 \times \mathrm{R}_{\mathrm{z}}$, relative to a reference line of $\mathrm{C}_{\text {ref. }} 5 \%$.

| Surface profile $\mu$ inch | $\mathrm{R}_{\mathrm{a}}$ | $\mathrm{R}_{\mathrm{z}}$ | $\mathrm{R}_{\mathrm{mr}}$ |
| :--- | :--- | :--- | :--- | :--- |
| closed profile form |  |  |  |
| open profile form | 8 | $70 \%$ |  |

Figure 4 Profile forms of surfaces
Figure 4 shows two surface profiles, both of which exhibit nearly the same value for $\mathrm{R}_{\mathrm{z}}$ in the test procedure. The difference becomes obvious only when the material contact area of the surface roughness profiles are compared. These show that the upper roughness profile with ( $R_{m r}=70 \%$ ) has the better seal/mating surface ratio.

## Hardware

For optimum performance Trelleborg Sealing Solutions recommends a piston rod of chrome-plated steel.

Material: preferably $42 \mathrm{CrMo4V}$, purity class K3 to DIN 50602.

Induction hardened

## Hardening depth

 .0008 to .0012 inch, polishedRoughness

Material contact area
Cut depth
$\min$. HRC 45
min .0 .1 inches

For other rod materials, special coatings and treatments, please contact your local Trelleborg Sealing Solutions Company.

## Rod Seals

## Installation Instructions

The following points should be observed before installation of the seals:

- Ensure the piston rod has a lead-in chamfer; if not, use an installation sleeve
- Deburr and chamfer or round sharp edges, cover the tips of screw threads
- Remove machining residues such as chips, dirt and other foreign particles and carefully clean all parts
- The seals can be installed more easily if the rod is greased or oiled. Attention must be paid to the compatibility of the seal materials with these lubricants. Use only grease without solid additives (e.g. molybdenum disulphide or zinc sulphide).
- Use no sharp-edged installation tools

## Installation in Split Grooves

Installation in split grooves is problem-free. The sequence of installation corresponds to the configuration of the seal, whereby the individual seal elements must not be allowed to twist. During final installation (insertion of the piston rod into the seal), elastomer or spring-energized seals must be sized. The piston rod itself can be used for this purpose, provided that it has a long lead-in chamfer, or use a sizing sleeve.

Figure 5 Installation in a split groove

## Installation in Closed Grooves

By following the instructions in each seal type description (sizes for closed or split grooves) or using the light series for Turcon ${ }^{\circledR}$ seals, it will result in a problem-free installation of our rod seal elements of small diameters.

For Zurcon ${ }^{\circledR}$ and polyurethane (not Turcon ${ }^{\circledR}$ ) seals, the use of installation tools is recommended. If installation has to be performed without installation tools, however, the following points should be observed:

- Place the O-Ring into the groove (not necessary with U-Cups)
- Compress the Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$ seals into a kidney shape. The seal must have no sharp bends (Figure 6)!

Figure 6 Kidney-shaped deformation of the seal ring

- Place the seal ring in compressed form into the groove and push against the O-Ring in the direction of the arrow (Figure 7).

Figure 7 Inserting the seal ring into the closed groove

- After placing into the groove, form the seal into a ring again in the groove by hand.
- Finally size the seal ring using a mandrel which should have a chamfer of $10^{\circ}$ to $15^{\circ}$ over a length of approx. 30 mm (1.181 inches)

The sizing mandrel should be made from a polymer material (e.g. polyamide) with good sliding characteristics and high surface quality in order to avoid damage to the seals.
The piston rod itself can also be used for calibration, provided it has a sufficiently long lead-in chamfer.

Figure 8 Installation in a closed groove

Figure 9 Calibration of the installed seal
Table VI Closed groove installation for Stepseal ${ }^{\circledR}$ 2K

| Series | Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ can be installed in closed grooves above the following rod diameters and in the following Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ materials *: |  |

## Rod Seals

## Installation of Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

Installation in closed grooves is possible for diameters from 12 mm (. 472 inches) using the following procedure:

- Place the O-Ring into the groove.
- Compress the Turcon ${ }^{\circledR}$ seal into a kidney shape, avoid making sharp bends on the seal (Figure 10).
- Place the seal ring in compressed form into the groove and push against the O-Ring in the direction of the arrow in the groove by hand (Figure 11).
For diameters smaller than 30 mm ( 1.181 inches) an inserter tube is recommended (Figure 12).
- Finally, size the seal ring using a mandrel which should have a chamfer of $10^{\circ}$ to $15^{\circ}$ over a min. length of 30 mm (1.181 inches) (Figure 13).

Figure 10 Kidney-shaped deformation

Figure 11 Inserting the seal ring into the closed groove

Figure 12 Insertion with an inserter tube

Figure 13 Calibration of the installed seal by means of a calibration mandrel

## Installation of Spring Energized Seals

Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2 seals should preferably be installed in split grooves.

Installation in half-open grooves is possible with a snap fitting. Figure 14 shows the design of the groove.

Figure 14 Installation in a half-open groove

## Rod Seals

## Quality Criteria

The cost-effective use of seals and bearings is highly influenced by the quality criteria applied in production. Seals and bearings from Trelleborg Sealing Solutions are continuously monitored according to strict quality standards from material acquisition to delivery.

Certification of our production plants in accordance with international standards QS 9000 / ISO 9000 meets the specific requirements for quality control and management of purchasing, production and marketing functions.
Our quality policy is consistently controlled by strict procedures and guidelines which are implemented within all strategic areas of the company.
All testing of materials and products is performed in accordance with accepted test standards and specifications, e.g. random sample testing in accordance with DIN ISO 2859, part 1.

Inspection specifications correspond to standards applicable to individual product groups or manufacturing locations (e.g. for O-Rings: ISO 3601).

The tenth digit of our part number defines the quality characteristics of the part. A hyphen indicates compliance with standard quality criteria outlined in this catalog. Customer-specific requirements are indicated by a different symbol in this position. Customers who require special quality criteria should contact their local Trelleborg Sealing Solutions sales office for assistance. We have experience in meeting all customer quality requirements.

## Storage information

Seals and bearings are often stored as spare parts for prolonged periods. Most rubbers change in physical properties during storage and ultimately become unserviceable due to excessive hardening, softening, cracking, crazing or other surface degradation. These changes may be the result of particular factors or combination of factors, such as deformation, oxygen, ozone, light, heat, humidity or oils and solvents.

With a few simple precautions, the shelf life of these products can be considerably lengthened.

Fundamental instructions on storage, cleaning and maintenance of elastomeric seal elements are described in international standards, such as:

DIN 7716 / BS 3F68: 1977,
ISO 2230, or
DIN 9088
The standards give several recommendations for the storage and the shelf life of elastomers, depending on the material classes.

The following recommendations are based on the several standards and are intended to provide the most suitable conditions for storage of rubbers. They should be observed to maintain the optimum physical and chemical values of the parts:

## Heat

The storage temperature should preferable be between $+41^{\circ} \mathrm{F}$ and $+77^{\circ} \mathrm{F}\left(+5^{\circ} \mathrm{C}\right.$ and $+25^{\circ} \mathrm{C}$ ). Direct contact with sources of heat such as boilers, radiators and direct sunlight should be avoided.
If the storage temperature is below $+59^{\circ} \mathrm{F}\left(+15^{\circ} \mathrm{C}\right)$, care should be taken to avoid distorting them during handling at that temperature as they may have stiffened. In this case the temperature of the articles should be raised to approximately $+68^{\circ} \mathrm{F}\left(+20^{\circ} \mathrm{C}\right)$ before they are put into service.

## Humidity

The relative humidity in the store room should be below $70 \%$. Very moist or very dry conditions should be avoided. Condensation should not occur.

## Light

Elastomeric seals should be protected from light sources, in particular direct sunlight or strong artificial light with an ultraviolet content. Individual storage bags offer the best protection as long as they are UV resistant.
It is advisable to cover any windows of storage rooms with a red or orange coating or screen.

## Radiation

Precaution should be taken to protect stored articles from all sources of ionizing radiation likely to cause damage to stored articles.

## Oxygen and ozone

Where possible, elastomeric materials should be protected from circulating air by wrapping, storage in airtight containers or by other suitable means.
As ozone is particularly deleterious to some elastomeric seals, storage rooms should not contain any equipment that is capable of generating ozone, such as mercury vapor lamps, high voltage electrical equipment, electric motors or other equipment which may give rise to electric sparks or silent electrical discharges. Combustion gases and organic vapor should be excluded from storage rooms as they may give rise to ozone via photochemical processes.

## Deformation

Elastomeric materials should, wherever possible, be stored in a relaxed condition free from tension, compression or other deformation. Where articles are packed in a strain-free condition they should be stored in their original packaging.

## Contact with liquid and semi-solid materials

Elastomeric seals should not be allowed to come into contact with solvents, oils, greases or any other semi-solid materials at any time during storage, unless so packed by the manufacturer.

## Contact with metal and non-metals

Direct contact with certain metals, e.g. manganese, iron and particularly copper and its alloys, e.g. brass and compounds of these materials are known to have deleterious effects on some rubbers. Elastomeric seals should not be stored in contact with such metals.

Because of possible transfer of plasticizers or other ingredients, rubbers must not be stored in contact with PVC. Different rubbers should preferably be separated from each other.

## Cleaning

Where necessary, cleaning should be carried out with the aid of soap and water or methylated spirits. Water should not, however, be permitted to come into contact with fabric-reinforced components, bonded seals (because of corrosion) or polyurethane rubbers. Disinfectants or other organic solvents, as well as sharp-edged objects, must not be used. The articles should be dried at room temperature and not placed near a source of heat.

Shelf life and shelf life control
The useful life of a elastomeric seals will depend to a large extent on the type of rubber. When stored under the recommended conditions (above sections) the below given shelf life of several materials should be considered.

| AU, Thermoplastics | 4 years |
| :--- | :---: |
| NBR, HNBR, CR | 6 years |
| EPDM | 8 years |
| FKM, VMQ, FVMQ | 10 years |
| FFKM, Isolast ${ }^{\circledR}$ | 18 years |
| PTFE, Turcon ${ }^{\circledR}$ | unlimited |

Elastomeric seals should be inspected after the given period. After this, giving an extension period is possible.
Rubber details and components less than 1.5 mm (. 059 inches) thick are liable to be more seriously affected by oxidation degradation even when stored in satisfactory conditions as recommended. Therefore they may be inspected and tested more frequently than mentioned above.
Rubber details / seals in assembled components
It is recommended that the units should be exercised at least every six months and that the maximum period a rubber detail be allowed to remain assembled within a stored unit, without inspection, be a total of the initial period stated above and the extension period. Naturally this will depend on the design of the unit concerned.

## TURCON ${ }^{\circledR}$ STEPSEAL ${ }^{\circledR} 2 \mathrm{~K}$

- Single-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal .
- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR}$ 2K*

## Description

Rod seals must exhibit no dynamic leakage to the atmosphere side under all operating conditions and must be statically completely leak tight when the machine is at a standstill. Furthermore, they should achieve a high degree of mechanical efficiency through low friction and be easy to install in small grooves. Costs and service life must meet the high expectations of the operator.
The rod seal Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ comes closest to satisfying these ideal demands. Since the first Stepseal ${ }^{\text {® }}$ was patented and introduced to the market in 1972, Trelleborg Sealing Solutions has maintained the series of technically outstanding seal elements through continuous innovative development of the design and of the Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ materials. Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ continues the tradition for improvement.
With the introduction of Stepseal ${ }^{\circledR}$ it was possible for the first time to arrange several seals, one behind the other, thus allowing statically and dynamically tight doubleacting tandem seal configurations to be created, without any disturbing build-up of intermediate pressure.

The single-acting seal element is made of high-grade Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$ materials with outstanding sliding and wear resistance properties. It is installed according to ISO 7425/2 and Trelleborg Sealing Solutions standard grooves, using an O-Ring as the energizing element.

Figure 15 Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$

Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ - Elastomer O-Ring

Low friction, no stick-slip High form stability and wear resistance Meets demanding service conditions High flexibility for easy installation

Geometry Patented and patent pending geometry Proven seal edge design Resist damage during installation and service

High flexibility to compensate hardware tolerances and movement. Elastomer materials available to meet a wide variety of service conditions

O-Ring Relief Chamfer Reduced seal load under pressure. Reduced seal friction

## Contoured Rear

 Improved back-pumping of residual oil film for increased sealing efficiency. Increased hardware tolerances Increased radial clearance[^3]
## Method of operation

The sealing performance of Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ (Figure 15) results from the hydrodynamic properties of the seal. The classic Stepseal ${ }^{\circledR}$ seal edge creates a steep contact pressure gradient on the high pressure side and a shallow contact pressure gradient on the low pressure side. The controlled pressure gradients minimizes fluid adherence to the piston rod during the extending stroke, and enables residual fluid film on the rod to be returned into the system on the return stroke. This is united with new patented design features which further improve the performance of Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ under severe service conditions.

The O-Ring relief chamfer reduces pressure loading on the seal, whereby contact with the rod is optimized and sealing performance is improved at high service pressures. The special high-lift rear chamfer combines a smooth downstream sealing face with the ability to meet large radial clearances and hardware tolerances.

Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ gives high static and dynamic sealing performance, and the build-up of intermediate pressure often found with tandem seal configurations (see Figure 16 ) is efficiently suppressed.

## Advantages

- High static and dynamic sealing effect
- High extrusion resistance, meets high hardware clearances
- Low friction, high efficiency
- Stick-slip free starting, no sticking
- High abrasion resistance, high operational reliability
- Wide range of application temperatures and high resistance to chemicals, depending on the choice of O-Ring material
- Simple installation without seal edge deformation
- Available for all diameters up to 102 inches ( $2,600 \mathrm{~mm}$ ) rod dia.

## Technical data

Operating pressure: Up to $11,600 \mathrm{psi}(80 \mathrm{MPa})$

| Velocity: | Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$ with <br> reciprocating movements, frequency <br> up to 5 Hz |
| :--- | :--- |
| Temperature: | $-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ <br> depending on O-Ring material) |
| Media: | Mineral oil-based hydraulic fluids, <br> flame retardant hydraulic fluids, <br> environmentally safe hydraulic <br> fluids (bio-oils), water and others, <br> depending on the O-Ring material <br> (see Table X) |
| Clearance: | The maximum permissible radial <br> clearance $S_{\text {max }}$ is shown in Table XI, <br> as a function of the operating <br> pressure and functional diameter. |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

The following material combination has proven effective for applications with hydraulic oils containing zinc:

| Seal Ring: | Turcon $^{\circledR}$ T46 |  |
| :--- | :--- | :--- |
| O-Ring: | NBR, 70 Shore A | N |
|  | FKM, 70 Shore A | V |
| Set code: | T46N/T46V |  |

For specific applications, other material combinations as listed in Table X, may also be used.

## Series

Different cross section sizes are recommended as a function of the seal diameters. These are the criteria for these recommendations.
Table XI, shows the relationship between the series number according to the seal diameter range and the different application class sizes. These application classes are:
Standard application: General applications in which no exceptional operating conditions exist

Light-duty application:
Applications with demands for reduced friction or for smaller grooves

Heavy-duty application: For exceptional operating loads such as high pressures, pressure peaks, etc

Table IX Available range

| Series No. | Rod Diameter <br> $\mathbf{d}_{\mathbf{N}} \mathbf{f 8} / \mathrm{h} 9$ |
| :---: | :---: |
| RSF00 | $.080-5.125$ |
| RSF10 | $.250-10.000$ |
| RSF20 | $.375-17.500$ |
| RSF30 | $.500-25.500$ |
| RSF40 | $1.500-25.500$ |
| RSF50 | $7.750-40.000$ |
| RSF80 | $10.000-48.000$ |
| RSF60 | $25.500-99.999$ |

[^4]
## Application Examples

- Mobile hydraulic
- Standard cylinders
- Machine tools
- Injection molding machines
- Presses
- Automobile industry
- Hydraulic hammers
- Servo hydraulics

## Redundant Sealing System

In many applications, secondary seal systems are demanded. Figure 16 shows such a tandem configuration with the Stepseal ${ }^{\circledR} 2 \mathrm{~K}$.

Figure 16 Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ and Zurcon ${ }^{\circledR}$ Rimseal in tandem configuration

In this configuration it must be noted that a sufficiently large space is formed between the seals to take the hydraulic fluid, as shown in the figure.

Depending on the application and the operating conditions, the combination of different materials offers a further improvement in the sealing efficiency and the service life of the system, e.g. in hydraulic cylinders subject to high loads and under rough operating conditions, the primary seal should be made of Turcon ${ }^{\circledR}$ and the secondary seal of Zurcon ${ }^{\circledR}$.

Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ elements should always be used in combination with a double-acting scraper to provide an optimum sealing effect.

The scraper Turcon ${ }^{\circledR}$ Excluder $^{\circledR}$ 2, Turcon ${ }^{\circledR}$ Excluder $^{\circledR}$ 5, DA17, DA22 and DA24 are well suited to such applications. For further details, please refer to our "Scrapers" catalog.

* At pressures $\mathbf{>} \mathbf{4 0} \mathbf{~ M p a}(\mathbf{5 , 8 0 0} \mathbf{~ p s i})$ : use diameter tolerance $\mathrm{H} 8 / f 8$ (bore / rod) in the area behind the seal; or consult Trelleborg Sealing Solutions for alternative material or profiles.

1) For easier installation in closed grooves with small rod diameters ( $<40 \mathrm{~mm}$ ( 1.575 inches)).

## Ordering example

Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ complete with O-Ring, standard application, Series RSF4 (from Table XI).
Rod diameter: $\quad d_{N}=8.000$ inches
TSS Part No.: RSF408000 (from Table XII)
Select the material from Table X. The corresponding code numbers are appended to the TSS Part No. (from Table XII). Together these form the TSS Article No.
The TSS Article No. for all intermediate sizes not shown in Table XII can be determined following the example below.
** For diameters $\geq 102$ inches please consult your Trelleborg Sealing Solutions sales office for special TSS Article No.

## Notes:

1) Tolerances used are per ISO-286; ISO System of Limits and Fits. The tolerances are converted from metric and rounded to the nearest three place decimal.
2) The clearances stated as $S$ in the above table are for when the seal is specified with Slydring ${ }^{\circledR}$ bearings. When not incorporating Slydring ${ }^{\circledR}$ bearings, the diametral clearance should be reduced.
3) Consult your sales office for diameters that exceed those listed in the above table.

## ZURCON ${ }^{\circledR}$ U.CUP RU9

- Single-Acting -
- Low-friction Zurcon ${ }^{\circledR}$ U.Cup .

## - Material - <br> - Zurcon ${ }^{\circledR}$.

## Zurcon ${ }^{\circledR}$ U-Cup RU9

## Zurcon ${ }^{\circledR}$ U-Cup RU9

## Introduction

Rod seals are particularly exposed to pressure and friction. A long service life is a specific requirement of piston rods. Features such as wear and extrusion resistance, media and temperature compatibility, low friction, compact installation dimensions and ease of assembly are also essential and require the introduction of new products and materials. It is against this background that we have developed the Zurcon ${ }^{\circledR}$ U-Cup RU9.

## Description

Due to its special design, behind the dynamic seal lip, the Zurcon ${ }^{\circledR}$ U-Cup RU9 with its structure of slide segments interspersed by back-pumping channels features, excellent back-pumping ability across the entire pressure range. The dynamic seal slide segments also have a micro-structure with excellent tribological and sealing characteristics. As well as increasing the sealing ability of the U-Cup RU9, this also ensures a constant lubrication film underneath the seal sliding surface, reducing breakaway force even after prolonged periods of rest, and reduces dynamic friction force.

Figure 18 U-Cup, type RU9

## Zurcon $^{\circledR}$ U-Cup RU9

## Friction

The friction force of U-Cups dramatically increases between 362 and 1,450 psi. The Zurcon ${ }^{\text {® }}$ U-Cup RU9 has a unique feature. As the system pressure increases, the contact surface between the U-Cup and the piston rod increases. Once a specific system pressure is reached, the seal deforms to such an extent that its entire frictiongenerating inside surface gets in contact with the piston rod. Due to the special design of Zurcon ${ }^{\circledR}$ U-Cup RU9 there is improved pressure distribution on the rod. The resulting tribological benefits restrict the increase in friction. When we compare the friction values of conventional U-Cups with those of the Zurcon ${ }^{\circledR}$ U-Cup RU9 the results are selfevident.

Figure 19 Friction dependent on pressure

Figure 20 Friction dependent on speed

Figure 21 How the Zurcon ${ }^{\circledR}$ U-Cup RU9 performs under pressure

## Sealing Performance

The high sealing performance is achieved by:

- Interference fit at the external diameter
- Special shape of both trimmed seal lips
- Controlled pressure distribution and hydrodynamic backpumping ability over a wide pressure range

Figure 22 Leakage performance dependent on U-Cup type

## Zurcon ${ }^{\circledR}$ U-Cup RU9

## Radial clearance

The new Zurcon ${ }^{\circledR}$ RU9 design combined with the special compound properties shows better extrusion resistance compared to a standard U-Cup under all working conditions. The hardware clearance can be increased significantly.

Figure 23 Radial clearance " S " as function of pressure

## Advantages

- Lower friction than standard U-Cups
- Lower heat generation than standard U-Cups
- High extrusion resistance
- Excellent dynamic and static sealing
- Optimum environment protection
- Back pumping ability over the entire pressure range achieved by grooved profile
- Suitable with the Zurcon ${ }^{\circledR}$ Buffer Seal as secondary seal in tandem design
- Suitable for sealing systems with double scraper
- Seal stability within the groove

## Application Examples

Zurcon ${ }^{\circledR}$ U-Cup RU9 can be used in all applications in which previously a conventional U-Cup was applied, such as:

- Hydraulic cylinders
- Construction machinery
- Fork lifts
- Truck cranes
- Telescopic cylinders
- Agricultural machines
- Machine tools
- Injection molding machines
- Hydraulic presses
- Gas spring

In medium/heavy duty applications the preferred solution for tandem rod sealing systems is the combination of the Zurcon ${ }^{\circledR}$ Buffer Seal primary seal and Zurcon ${ }^{\circledR}$ U-Cup RU9 in conjunction with a double acting scraper.

## Materials

Zurcon ${ }^{\circledR}$ Z20 standard polyurethane 93 Shore A Zurcon ${ }^{\circledR}$ Z22 premium polyurethane 93 Shore A

Color:
Turquoise
The Zurcon ${ }^{\circledR}$ polyurethane has high abrasion resistance, a low compression set, high extrusion resistance and a wide temperature range.

## Technical Data

Operating conditions:
Pressure:
Velocity:
Temperature:
Zurcon ${ }^{\circledR}$ Z20 Standard:

Zurcon ${ }^{\circledR}$ Z22 Premium:

## Media:

Hydraulic fluids based on mineral oil:

Synthetic and natural ester
HEES, HETG:
Flame-retardant hydraulic
fluids HFA/HFB:
$-31^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}$
$\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$
up to $+140^{\circ} \mathrm{F}$ $\left(+60^{\circ} \mathrm{C}\right)$
up to $+104^{\circ} \mathrm{F}$ $\left(+40^{\circ} \mathrm{C}\right)$

## Important Note:

The above stated limits for pressure and speed are maximum values individually. Friction heat generated by the combination of pressure and speed may cause local heat built-up. Care should be taken not to apply high values for pressure and speed at the same time.

- O-Ring-Energized Zurcon ${ }^{\circledR}$ Slipper Seal -
- Material -

## Zurcon ${ }^{\circledR}$ Rimseal

## Description

When the field of application and system requirements make high demands on leakage control and operational reliability, a redundant sealing system is necessary to ensure reliable sealing of hydraulic cylinders at the piston rod. Sealing systems with elastomer-energized polymer seals are a proven answer to widely varying demands for standardized grooves, simple installation, resistance to media, high and low temperatures and pressures. The system offers enormous flexibility in the choice and matching of materials.

The piston rod sealing system for hydraulic cylinders subject to heavy loads should consist of three elements:
The Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ is used as primary seal. This seal element offers the back pumping property necessary for redundant rod seal systems as well as good resistance to high and low temperatures and high media resistance.

The Zurcon ${ }^{\circledR}$ Rimseal was developed as the secondary seal in this system to ensure reliable sealing of thin oil films at low secondary pressures. A Zurcon ${ }^{\circledR}$ material (polyurethane Shore D 58) is used combined with a new seal profile.
The contact pressure curve is automatically optimized under dynamic conditions.
The final outer element of the redundant sealing system is a double-acting scraper seal (e.g. DA 24, DA 22, DA 17, Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR}$ 2, Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR}$ 5).
The optimum sealing system thus consists of three independent lip seals installed in line, whereby the hardness of the material decreases from the pressure side to the atmospheric side.

Figure 26 Zurcon ${ }^{\circledR}$ Rimseal

## Method of Operation

The Zurcon ${ }^{\circledR}$ Rimseal is an O-Ring-energized seal element. The changes in seal position in the groove necessary for an optimum sealing function are guaranteed by the combination of the two component parts (O-Ring and seal ring).

In order to achieve a contact pressure curve which enhances the sealing effect, the seal has a chamfer on the low pressure side. When under pressure and exposed to friction against the piston rod, this chamfer causes the seal to tilt slightly so that the seal ring is forced against the side of the groove. This creates an area of maximum pressure at the edge of the seal.
When the Zurcon ${ }^{\circledR}$ Rimseal is used in a system with a double-acting scraper DA 24 (DA 22, DA 17, Excluder ${ }^{\circledR}$ 2, Excluder ${ }^{\circledR}$ 5), the sealing function of the system must be assured even if pressure build-up occurs between the Zurcon ${ }^{\circledR}$ Rimseal and the double-acting scraper seal.
For this reason, the high-pressure side of the seal ring also has a chamfer which, in the event of a build-up of pressure behind the Zurcon ${ }^{\circledR}$ Rimseal, comes into contact with the flank of the groove. The Zurcon ${ }^{\circledR}$ Rimseal moves in the groove so that a contact pressure distribution is obtained on the piston rod which enhances the back pumping effect.

## Advantages

- High static and dynamic leak tightness
- Low friction for reduced power loss
- High wear resistance for long service life
- Small groove
- Easy installation
- Optimum system element
- ISO/DIN grooves optional
- Available for any diameter from . 040 inches ( 8 mm ) to 86.500 inches ( $2,200 \mathrm{~mm}$ )

## Application Examples

- Mobile hydraulics
- Standard cylinders
- Machine tools
- Injection molding machines
- Presses

## Technical Data

| Pressure: | In tandem system: <br> Up to 8,700 psi ( 60 MPa ) <br> As an individual element: 3,625 psi ( 25 MPa ) |
| :---: | :---: |
| Velocity: | $16.5 \mathrm{ft} / \mathrm{s}(5 \mathrm{~m} / \mathrm{s})$ with short strokes (<40.000 inches ( 1 m )) in tandem system |
| Temperature: | $-49^{\circ} \mathrm{F}$ to $+212^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+100^{\circ} \mathrm{C}\right)$ depending on O-Ring material |
| Media: | Hydraulic fluids <br> -Mineral oil <br> -Synthetic and natural esters <br> -HEES. HETG up to $+140^{\circ} \mathrm{F}\left(+60^{\circ} \mathrm{C}\right)$ <br> -Flame retardant fluids HFA. HFC |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

## Materials

The Zurcon ${ }^{\circledR}$ Rimseal is made in the following material combinations as standard:

Seal ring:

> Zurcon $^{\circledR}$ Z52
> Special polyurethane
> 58 Shore D

O-Ring: NBR. 70 Shore A
Set code: $\quad$ Z52N or Z52T

## Series

The Zurcon ${ }^{\circledR}$ Rimseal is a system seal and is preferably used in tandem sealing systems in conjunction with the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$. The cross section series is identical with those for the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$.

## Redundant Sealing System

Redundant sealing systems are used where the application conditions no longer permit reliable sealing over the demanded service life with a single seal.
The property of the tandem sealing system is particularly important during cold starts when, due to the very high viscosity of the oil, the primary seal allows oil to pass as the piston rod is extended. In the tandem system the oil is heated as a result of the friction at the primary seal and is then reliably wiped off - at a now lower viscosity - by the secondary seal, the Zurcon ${ }^{\circledR}$ Rimseal.

As the piston rod is retracted, the oil is stored in the reservoir between the seals, and is then pumped back against the system pressure by the hydrodynamics in the seal clearance of the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$.
Particularly with strokes of more than 40.000 inches (1 meter), constructional measures have to be taken to provide a storage chamber between the seals.

The Zurcon ${ }^{\circledR}$ Rimseal is designed so that it also has the back pumping properties necessary when using a double-acting scraper in the rod sealing system.

Due to the controlled sealing behavior of the individual elements in the sealing system and the appropriate combination of the seal materials, a rod seal system is obtained with a low overall friction.
The Figure 27 shows a redundant rod seal system consisting of Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$, Zurcon ${ }^{\circledR}$ Rimseal and rod scraper DA 22 with corresponding wear ring arrangement.

Figure 27 Zurcon ${ }^{\circledR}$ Rimseal in tandem configuration

## ZURCON ${ }^{\circledR}$ buFFER SEAL

# - Single-Acting - <br> - Zurcon ${ }^{\circledR}$ Rod Buffer Seal - <br> - with Integrated Back-up Ring - 

- Material $-{ }^{-}$.

## Zurcon ${ }^{\circledR}$ Buffer Seal

## Introduction

In heavy duty applications, leak-free performance and high service life cannot be assured by a single sealing element; therefore, specially developed system seals are arranged in series, building a tandem configuration.
Each sealing element in a system has its specific function and their interaction needs to be secured to get a redundant sealing system. The primary seal in Zurcon ${ }^{\text {® }}$ material has excellent wear and extrusion resistance under extreme working conditions. It allows a fine lubrication film past this first barrier, ensuring the necessary lubrication of the secondary sealing element for long service life.

The tandem arrangement requires an outstanding backpumping ability of the primary seal and the secondary seal, if a double acting scraper is installed.

## Description

The single-acting Zurcon ${ }^{\circledR}$ Buffer Seal is designed as a heavy duty primary rod seal. The design of the product incorporates a combination of a Zurcon ${ }^{\circledR}$ sealing ring along with a back-up ring.

By utilizing two materials, the performance of the product is enhanced and life is extended. The Zurcon ${ }^{\circledR}$ Buffer Seal is designed in such a way that sealing performance is not compromised under system pressure extremes. At low system pressure, the resilience of the Zurcon ${ }^{(8)}$ material allows for effective sealing. At high system pressure, the back-up ring is designed to contract into the extrusion gap, protecting the Zurcon ${ }^{\circledR}$ seal ring.

Figure 29 Tandem configuration

## Friction

The Zurcon ${ }^{\circledR}$ Buffer Seal with its special $U$ shape and its rounded dynamic lip is able to guarantee an optimal pressure distribution and a constant lubrication of the rod across the entire pressure range.

Figure 30 Zurcon ${ }^{\circledR}$ Buffer Seal un-pressurized
In un-pressurized conditions head-on slots on the dynamic lip assure right positioning avoiding any risk of blow-by. The Zurcon ${ }^{\circledR}$ Buffer Seal is ready for fast activation protecting the secondary seal from the peak of pressure.

Figure 31 Pressure distribution at 5,800 psi ( 40 MPa )

## Zurcon ${ }^{\circledR}$ Buffer Seal

## Pressure relief

In a tandem configuration the Zurcon ${ }^{\circledR}$ Buffer Seal must assure quick and complete pressure relief in order to reduce friction and wear of the secondary seal. This increasing the life and overall sealing performance. The relief mechanism is activated by the special seal design through its thin, short and flexible static lip. The radial channels on the back side offer the fluid a direct stream up to both lips. A minimum difference between the pressure trapped and the pressure in the chamber is able to deflect the seal and recover the same pressure level.

Figure 32 Pressure relief with a back pressure bigger of 72.5 psi ( 0.5 MPa )

## Advantages

- Manufactured from Zurcon ${ }^{\circledR}$ and high-performance materials
- Conforms to ISO 7425/2 groove standards
- Suitable also for Stepseal ${ }^{\circledR}$ groove
- Excellent back-pumping over entire pressure range
- Resistant to high temperature and pressure
- Special design of dynamic seal lip for superior performance
- Designed with radial relief notches to prevent pressure trapping
- Superior wear and abrasion resistance
- Low compression set

## Application Examples

Medium and heavy duty applications:

- Mobile equipment
- Lift trucks
- Earthmoving equipment

## Materials - Standard application

For hydraulic components in mineral oils or medias with good lubricating performance

| Seal ring: | Zurcon ${ }^{\text {® }}$ Z20 <br> standard polyurethane <br> Polyacetal resin (POM) |
| :--- | :--- |
| Back-up ring: | Z2054 |

Materials - Low temperature application

Seal ring:
Back-up ring:
Set reference:
Z2254
Zurcon ${ }^{\circledR}$ polyurethane has high abrasion resistance, a low compression set, high extrusion resistance and a wide temperature range.

## Technical Data

Operating conditions: The Zurcon ${ }^{\circledR}$ Buffer Seal is designed for high pressure rod sealing applications in extreme conditions.

| Pressure: | Up to $5,800 \mathrm{psi}(40 \mathrm{MPa})$ |
| :--- | :--- |
|  | Up to 8,700 psi $(60 \mathrm{MPa})$ |

Velocity: Up to $3.30 \mathrm{ft} / \mathrm{s}(1 \mathrm{~m} / \mathrm{s})$
Temperature:
Zurcon ${ }^{\circledR}$ Z20 Standard:
$-31^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}$
$\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$
Zurcon ${ }^{\circledR}$ Z22 Premium:
$-49^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}$
$\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$
Media:
Hydraulic fluids based on mineral oil:
$-31^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}$ $\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$

Synthetic and natural
ester HEES, HETG:
Up to $+140^{\circ} \mathrm{F}\left(+60^{\circ} \mathrm{C}\right)$
Flame-retardant
hydraulic fluids
HFA/HFB:
Up to $+104^{\circ} \mathrm{F}\left(+40^{\circ} \mathrm{C}\right)$

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

| RUH4 | 4.625-9.750 | - | $\mathrm{d}_{\mathrm{N}+} .807$ | . 319 | . 035 | . 031 | . 024 | . 014 |

## Ordering Example

TSS Series No.:
Rod diameter: TSS Part No.:

## Material

Compound:

## Notes:

1) Tolerances used are per ISO-286; ISO System of Limits and Fits. The tolerances are converted from metric and rounded to the nearest three place decimal.
2) The clearance stated as $S$ in the above table are for when the seal is specified with Slydring bearings. When not incorporating Slydring bearings, the diametral clearance should be reduced.
3) Consult your local Trelleborg Sealing Solutions sales office for diameters that exceed those listed in the above table.

## TURCON ${ }^{\circledR}{ }^{\text {GLYD }}$ RING $^{\circledR}{ }^{\top}$

- Double-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathbf{T}^{*}$

## Description

Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{T}$ is a further technical development of the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ seal which has been successfully used for decades. It is fully interchangeable with the earlier Glyd Ring ${ }^{\circledR}$ seals in all new applications. Glyd Ring ${ }^{\circledR}$ T meets all the market demands for a function-specific seal solution, observing economic and ecological aspects.
The benefits of the patented seal concept are provided by the innovative functional principle of the trapezoidal profile cross-section.

* Patent No.:

| DE | 4140833 C3 |
| :--- | :--- |
| EP | 0582593 |
| Japan | 2799367 |
| USA | $5,433,452$ |

Both lateral profile flanks are inclined so that the seal profile tapers towards the seal surface. The profile can thus retain the robust and compact form typical of piston seals without losing any of the flexibility required to achieve a pressure-related maximum compression (Figure 34).
The edge angle created by the special Glyd Ring ${ }^{\circledR}$ T crosssectional form permits an additional degree of freedom and enables a slight tilting movement of the seal. The maximum compression is always shifted towards the area of the seal edge directly exposed to the pressure. On the low-pressure edge of the seal, on the other hand, the Glyd Ring ${ }^{\circledR}$ T exhibits only zones with neutral strains without compressive or shearing loads, effectively reducing the danger of gap extrusion. The resulting benefits for the user can be seen in the following list.

Figure 34 Turcon ${ }^{\circledR}$ Glyd Ring $^{\circledR}$ T

## Advantages

The benefits offered to date by the Glyd Ring ${ }^{\circledR}$ are still retained in full, and are now complemented by a number of further important advantages:

- Very good static leak-tightness
- Increased clearance possible (approx. $+50 \%$ ), depending on the operating conditions
- Low friction, no stick-slip effect
- Simple groove design
- Available for all rod diameters up to 102 inches ( $2,600 \mathrm{~mm}$ )

## Application Examples

The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{T}$ is the recommended sealing element for double acting inside sealing seal for hydraulic components such as:

- Injection molding machines
- Machine tools
- Presses
- Handling machinery
- Agriculture
- Valves

It is particularly recommended for heavy duty and large diameter applications.

## Technical Data

$\begin{array}{ll}\text { Operating pressure: } & \text { Up to } 11,600 \mathrm{psi}(80 \mathrm{MPa}) \\ \text { Velocity: } & \text { Up to } 50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})\end{array}$ Temperature: $\left.\quad \begin{array}{l}-49^{\circ} \mathrm{F} \text { to }+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C} \text { to }+200^{\circ} \mathrm{C}\right) \\ \text { (depending on O-Ring material) }\end{array}\right\}$

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

## Standard Application:

- For hydraulic components with reciprocating movement in mineral oils containing zinc or medium with good lubricating performance

| Seal Ring: | Turcon $^{\circledR}$ T46 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set code: | T46N or T46V |

## Special Application:

- Non-lubricating fluids or pneumatic applications require self-lubricating sealing materials. Therefore we recommend:

| Seal Ring: | Turcon $^{\circledR}$ T40 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM <br> 70 Shore A depending on the <br> temperature |
| Set code: | T40N or T40V |

- If rougher surface finish must be sealed, we recommend:

| Seal Ring: | Zurcon $^{\circledR}$ Z51 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A |
| Set code: | Z51N |

* Installation with groove dimensions to ISO $7425 / 2$ is possible.
** At pressures $>\mathbf{4 0} \mathbf{~ M P a}(\mathbf{5}, \mathbf{8 0 0} \mathbf{~ p s i})$ use diameter tolerance $\mathrm{H} 8 / f 8$ (bore/rod) in area of the seal.

## Ordering Example

Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T, complete with O-Ring, standard application, Series RT14 (from Table XX)
$\begin{array}{ll}\text { Rod diameter: } & \mathrm{d}_{N}=8.000 \text { inches } \\ \text { TSS Part No.: } & \text { RT1408000 (from Table XXI) }\end{array}$
Select the material from Table XIX. The corresponding code numbers are appended to the TSS Part No. (from Table XXI).

Together these form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table XXI can be determined following the example below.
**** For diameters $\geq 20$ inches please consult your Trelleborg Sealing Solutions sales office for special TSS Article No.

Table XXI Installation dimensions / TSS Part No

## TURCON ${ }^{\circledR}$ GIYD RING ${ }^{\circledR}$

- Double-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$

## Description

Successfully used for decades, the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ is a very effective and reliable low friction seal. It is particularly suitable as a rod seal in both high and low pressure systems.
The double acting Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ is a combination of a Turcon ${ }^{\circledR}$ based slipper seal and an energizing O-Ring. It is produced with an interference fit which together with the squeeze of the O-Ring ensures a good sealing effect even at low pressure. At higher system pressures, the O-Ring is energized by the fluid, pushing the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ against the sealing face with increased force.

Figure 36 Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$
The geometry of the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ ensures a good static sealing and allows the lubricating hydrodynamic oil film to build under the seal in reciprocating applications.

## Notches

To assure that a rapid energizing of the seal takes place at sudden changes of pressure and direction of motion, the seal can be delivered with radial notches on both sides.

For ordering of Glyd Ring ${ }^{\circledR}$ with notches, see ordering example for this section.

Figure 37 Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$

## Advantages

- No stick-slip effect when starting for smooth operation
- Minimum static and dynamic friction coefficient for minimum energy loss and operating temperature
- Suitable for non lubricating fluids depending on seal material for optimum design flexibility
- High wear resistance ensures long service life
- No adhesive effect to the mating surface during long periods of inactivity or storage
- Suitable for most hydraulic fluids in relation to most modern hardware materials and surface finishes depending on material selected.
- Suitable for new environmentally safe hydraulic fluids
- Available for all rod diameters up to 102 inches (2,600 mm)

## Applications examples

Over several decades the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ has been successfully implemented in many applications as double or single-acting rod seals of hydraulic components such as:

- Injection molding machines
- Machine tools
- Presses
- Handling machinery
- Valves for hydraulic \& pneumatic circuits

## Technical Data

Operating conditions:
The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ is recommended for reciprocating (with a length of stroke at least twice the groove width) and helical movements.

| Pressure: | Up to $11,600 \mathrm{psi}(80 \mathrm{MPa})$ |
| :--- | :--- |
| Velocity: | Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$ |
| Frequency: | Up to 5 Hz |
| Temperature: | $-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ <br> (depending on O-Ring material) |
| Media: | Mineral oil-based hydraulic fluids, <br> barely flammable hydraulic fluids, <br> environmentally safe hydraulic fluids <br> (biological degradable oils), water, <br> air and others, depending on the |
|  | O-Ring material compatibility |
| Clearance: | The maximum permissible radial <br> clearance Smax is shown in the table |
|  | XXIII, as a function of the operating <br> pressure and functional diameter |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

## Standard Application:

For hydraulic components with reciprocating movement in mineral oils or medium with good lubricating performance

Turcon ${ }^{\circledR}$ seal: $\quad$ Turcon ${ }^{\circledR}$ T46
Energizer: $\quad$ O-Ring NBR 70 shore A or FKM 70 Shore A depending on the temperature

Set code: T46N or T46V

## Special Application:

Short stroke movements, non-lubricating fluids or pneumatic applications require self-lubricating sealing materials. Therefore we recommend:

| Turcon ${ }^{\circledR}$ Seal: | Turcon $^{\circledR}$ T29 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set code: | T29N or T29V |

If low friction coefficient is required, we recommend:

| Turcon ${ }^{\circledR}$ Seal: | Turcon ${ }^{\circledR}$ T05 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or <br> FKM 70 Shore A depending on the <br> temperature |
|  | For special requirements <br> other elastomers are available on <br> request |
| Set code: | T05N or T05V |

If rougher surface finish must be sealed, we recommend:

| Zurcon ${ }^{\circledR}$ seal: | Zurcon ${ }^{\circledR}$ Z51 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A |
| Set code: | Z51N |

Table XXII Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ Materials for Glyd Ring ${ }^{\circledR}$

* Installation with groove dimensions to ISO $7425 / 2$ is possible.
** At pressures $\mathbf{> 4 0} \mathbf{~ M P a}(\mathbf{5 , 8 0 0} \mathbf{~ p s i})$ use diameter tolerance H8/f8 (bore/rod) in area of the seal or consult Trelleborg Sealing Solutions for alternative material or profiles.

## Ordering example

Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$, complete with O-Ring, standard application, Series RG02 (from Table XXIII)
Rod diameter:
$d_{N}=1.625$ inches
TSS Part No.:
RG0201625 (from Table XXIV)
Select the material from Table XXII. The corresponding code numbers are appended to the TSS Part No. (from Table XXIV).
Together these form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table XXIV can be determined following the example below.

To order parts with notches substitute " N " for " 0 " in 3rd digit.
**** For diameters $\mathrm{d}_{\mathrm{N}} \geq 20$ inches please consult your Trelleborg Sealing Solutions sales office for special TSS Article No.

## TURCON ${ }^{®}$ GLYD RING $^{\circledR}{ }^{\circledR}$

## - Double-Acting -

- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C

## Description

The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ is a very effective and reliable low frictional seal. It is suitable as a double acting rod seal in both low and medium pressure systems.
The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ is a combination of a Turcon ${ }^{\circledR}$ based slipper seal and an energizing O-Ring. It is produced with an interference fit, which, together with the squeeze of the O-Ring, ensures a good sealing effect even at low pressure. At higher system pressures, the O-Ring is energized by the fluid, pushing the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ against the sealing face with increased force.

Figure 39 Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$

The geometry of the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C ensures an effective static sealing and allows the lubricating hydrodynamic fluid film to be build under the seal in reciprocating applications.

## Notches

To assure that a rapid energizing of the seal takes place at sudden changes of pressure and direction of motion, the seal can be delivered with radial "notches" on both sides.
Ordering of Glyd Ring ${ }^{\circledR} \mathrm{C}$ with "notches" see page 75.

Figure 40 Turcon $^{\circledR}$ Glyd Ring $^{\circledR} \mathrm{C}$ with notches on both sides

## Advantages

- No stick-slip effect when starting for smooth operation
- Minimum static and dynamic friction coefficient for a minimum energy loss and operating temperature
- Suitable for non lubricating fluids depending on seal material for optimum design flexibility
- High wear resistance ensures long service life
- No adhesive effect to the mating surface during long period of inactivity or storage
- Suitable for most hydraulic fluids in relation with most modern hardware materials and surface finish depending on material selected
- Suitable for new environmentally safe hydraulic fluids

## Applications examples

Over several decades the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ has been successfully implemented in a lot of applications as double acting Rod seals of hydraulic components such as:

- Machine tools
- Robotics
- Handling machinery
- Manipulators
- Valves for hydraulic \& pneumatic circuits
- Fittings
- Testing machinery
- Hydraulic power steering
- Brake systems
- Brake boosters
- Low temperature hydraulics
- Chemical processing equipment
- Filling machines

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C

## Technical Data

Operating conditions:
The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C is recommended for reciprocating movements (with a length of stroke at least twice the groove width).

Pressure: Up to 5,800 psi ( 40 MPa )
Velocity: $\quad U p$ to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$
Frequency: Up to 5 Hz .
Temperature: $-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ (depending on O-Ring Material)

Media: Mineral oil based hydraulic fluids, barely flammable hydraulic fluids, environmentally safe hydraulic fluids (biological degradable oils), water, air and others. Depending on the O-Ring material compatibility

Clearance: The maximum permissible radial clearance S max is shown in the table XXVI, as a function of the operating pressure and functional diameter.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

## Materials

## Standard Application:

For hydraulic components with reciprocating movement in mineral oils or medium with good lubricating performance.
Seal Ring: $\quad$ Turcon ${ }^{\circledR}$ T46
Energizer: $\quad$ O-Ring NBR 70 shore A or FKM 70
Shore A depending on the temperature

Set code: $\quad$ T46N or T46V

## Special Application:

- For short stroke movements, non-lubricating fluids or applications requiring self-lubricating sealing materials we recommend:
Seal Ring: $\quad$ Turcon ${ }^{\circledR}$ T40
Energizer: O-Ring NBR 70 Shore A or FKM 70 Shore A depending on the temperature

Set code: $\quad$ T40N or T40V

- If very low friction coefficient is required, we recommend:

Seal Ring: $\quad$ Turcon ${ }^{\circledR}$ T05
Energizer: $\quad$ O-Ring NBR 70 Shore A or FKM 70
Shore A depending on the temperature For special requirements other elastomers are available on request

Set code: T05N or T05V

- If rougher surface finish must be sealed, we recommend:

Seal Ring: Zurcon ${ }^{\circledR}$ Z51
Energizer: O-Ring NBR 70 Shore A
Set code: Z51N

- If exposure to water is required, we recommend:

Seal Ring: Zurcon ${ }^{\circledR}$ Z80
Energizer: O-Ring NBR 70 Shore A
Set code: Z80N

## Turcon $^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C

## TURCON ${ }^{\circledR}$ VL SEAL ${ }^{\circledR}$

# - Single-Acting - <br> - O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal - 

## - Material

- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ VL Seal ${ }^{\circledR \text { * }}$

## Description

The Turcon ${ }^{\circledR}$ VL Seal ${ }^{\circledR}$ incorporates theoretical and empirical experience in a new generation seal for the $21^{\text {st }}$ century.

The VL Seal ${ }^{\circledR}$ has been developed over the past few years as a new generation unidirectional Rod seal. The design has taken the latest empirical and theoretical experience into account in order to optimize performance, friction, leakage and service life. This has been achieved through in-house testing and qualified in customer applications. See test section.

The back-pumping effect allows the seal to relieve pressure trapped between tandem seals or between seals and double-acting scrapers.

Figure 42 Turcon ${ }^{\circledR}$ VL Seal ${ }^{\circledR}$

## Method of Operation

The sealing mechanism of the Turcon ${ }^{\circledR}$ VL Seal ${ }^{\circledR}$ (Figure 42) is based on the hydrodynamic properties of the seal. The specially formed seal edge has a steep contact pressure gradient on the high pressure side and a shallow contact pressure gradient on the low pressure side. This ensures that the fluid film adhering to the piston rod is returned to the high pressure chamber on the return stroke of the rod. This prevents the micro-fluid layer, that is carried out of the high pressure chamber when the piston rod is extended, from causing leaks.

This return delivery property prevents the build-up of interstage pressure normally associated with tandem seal configurations (Figure 43). Interstage pressure depends on the system pressure speed, the stroke length and the groove design.

* Patent pending. (US Patent No. 6,497,415)

Figure 43 Pressure Distribution in Tandem Installation

## Advantages

Compared with current rod seals, the following parameters have been improved:

- VL Seal ${ }^{\circledR}$ design allows gland for a reduced radial depth
- Tighter leakage control
- Lower friction: (Reduced contact area between seal and mating surface)
- Simplicity of design, using standard size O-Ring
- Featuring the Turcon ${ }^{\circledR}$ Stepsea ${ }^{\circledR}$ 2K back pumping effect
- The seal geometry prevents seal roll at low or shuffling pressure

## Technical Data

Operating pressure: 5,000 psi (35 MPa)
Velocity:
Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$ with reciprocating movements

Temperature range: $-65^{\circ} \mathrm{F}$ to $+390^{\circ} \mathrm{F}$
$\left(-54^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$
depending on elastomer material
Clearance: As per Table XXIX
Media: Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids, environmentally safe hydraulic fluids (bio-oils), Phosphate Ester, water and others, depending on the elastomer material

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

The seal is designed for MIL-G5514F/AS4716 groove geometries, but higher clearances can be accommodated according to service conditions.
The seal is designed for 0 back-up ring groove width, but installation may be faciliated by the use of a 1 back-up ring groove width and filling the groove with a back-up ring, as a spacer.

Seals for 1 \& 2 back-up ring groove widths can be used with solid b/u-rings (a scarfcut is only recommended for small diameters $<25 \mathrm{~mm} / 1 \mathrm{inch}$ ) to ease installation. Special back-up rings can be designed and supplied for unique application requirements.
The standard range can be installed in closed groove down to .800 inches $/ 20 \mathrm{~mm}, 0$ back-up ring. Smaller diameters down to .630 inches / 16 mm can be installed for 1 or 2 back-up ring groove width. Back-up ring to be installed afterwards.

## TURCON ${ }^{\circledR}$ VARISEAL ${ }^{\circledR}$ M2

- Single-Acting -
- Spring-Energized Turcon ${ }^{\otimes}$ U.Cup -
- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2

## Description

The Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2 is a single-acting seal consisting of a U-shaped seal jacket and a V-shaped corrosionresistant spring.
Variseal ${ }^{\circledR}$ M2 has an asymmetric seal profile. The heavy profile of its dynamic lip with an optimized front angle offers good leakage control, reduced friction and long service life.

Figure 45 Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2

At low and zero pressure, the metal spring provides the primary sealing force. As the system pressure increases, the main sealing force is achieved by the system pressure and ensures a tight seal from zero to high pressure.

The possibility of matching suitable materials for the seal and the spring allows use in a wide range of applications going beyond the field of hydraulics, e.g. in the chemical, pharmaceutical and foodstuff industries.
The Variseal ${ }^{\circledR}$ M2 can be sterilized and is available in a special Hi-Clean version where the spring cavity is filled with a silicone gel preventing contaminants from being entrapped in the seal. This design also works well in applications involving mud, slurries or adhesives to keep grit from packing into the seal cavity and inhibiting the spring action.

For applications with highly viscous media, please contact our engineering department.
Variseal ${ }^{\circledR}$ M2 seals can be installed in grooves to AS4716 and ISO 3771. The seal can only be installed to a limited extent in closed grooves, for installation instructions, see fig. 14.

## Advantages

- Resistant to most fluids and chemicals
- Low coefficients of friction
- Stick-slip-free operating for precise control
- High abrasion resistance and dimensional stability
- Can handle rapid changes in temperature
- No contamination in contact with foodstuffs, pharmaceutical and medicinal fluids
- High temperature range
- Sterilizable
- Unlimited shelf life

## Application Examples

Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR} \mathrm{M} 2$ is the recommended sealing element for all applications requiring stick slip free operation as well as chemical resistance against almost all media such as:

- Valves
- Pumps
- Separators
- Actuators
- Dosing devices

It requires a mating surface of high quality to avoid high wear rate.

## Technical Data

Operating conditions
Pressure: $\quad$ For static loads: 5,800 psi ( 40 MPa )
For dynamic loads: 2,900 psi ( 20 MPa )
Velocity: Reciprocating: Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$
Rotating: Up to $3.3 \mathrm{ft} / \mathrm{s}(1 \mathrm{~m} / \mathrm{s})$
Temperature: $\quad-94^{\circ} \mathrm{F}$ to $+500^{\circ} \mathrm{F}\left(-70^{\circ} \mathrm{C}\right.$ to $\left.+260^{\circ} \mathrm{C}\right)$
For specific applications beyond indicated range, please inquire

Media: Virtually all fluids, chemicals and gases

## Important Note:

The above data are maximum values, when using standard materials and geometries, and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

All materials used are physiologically safe. They contain no odor or taste-affecting substances.

The following material combination has proven effective for most fluid applications:

Seal ring: $\quad$ Turcon ${ }^{\circledR}$ T40
Spring: $\quad$ Stainless Steel Material No. AISI 301 Code S
For gas application use:
Seal ring:

$$
\text { Turcon }{ }^{\circledR} \text { T05/Zurcon }{ }^{\circledR} \text { Z80 }
$$

For use in accordance with the demands of the "Food and Drug Administration," suitable materials are available on request.

## TURCON ${ }^{\circledR}$ DOUBLE DELTA ${ }^{\circledR}$

- Double-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- For O-Ring Grooves .

## - Material <br> - Turcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

## Description

Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$ is an O-Ring-energized plastic-faced seal. The seal is designed to expand and improve the service parameters of O-Rings and is installed in existing O-Ring grooves.
Double Delta ${ }^{\circledR}$ combines the flexibility and response of O-Rings with the wear and friction characteristics of the Turcon ${ }^{\circledR}$ materials in dynamic applications.
The figures below show the cross section of the Double Delta ${ }^{\circledR}$.
The double-acting performance of the seal comes from the symmetrical cross section which allows the seal to respond to pressure in both directions.
Initial contact pressure is provided by radial compression of the O-Ring. When the system pressure is increased the O-Ring transforms this into additional contact pressure. The contact pressure of the seal is thereby automatically adjusted so sealing is ensured under all service conditions.

Figure 47 Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$ with and without pressure

## Advantages

- Compact groove dimensions and simple installation
- Low friction without stick-slip
- Resistance against wear and extrusion
- Rod seals available for all diameters from . 080 to 40.000 inches (2 to 999.9 mm )
- Standard cross sections cover AS 568B and important metric O-Rings, other cross sections available on request
- Also fits groove dimensions per MIL-G-5514F

## Application Examples

The Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$ is preferably used as a double acting seal for hydraulic and pneumatic equipment in sectors such as:

- Machine tools
- Handling devices
- Manipulators
- Valves
- Chemical process equipments

It is particularly recommended for light duty and small diameter applications.

## Technical Data

Operating conditions
\(\left.\begin{array}{ll}Pressure: \& Up to 5,000 \mathrm{psi}(35 \mathrm{MPa}) <br>
Velocity: \& Up to 50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s}) <br>
Temperature: \& -49^{\circ} \mathrm{F} to+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C} to+200^{\circ} \mathrm{C}\right) <br>

(according to O-Ring material)\end{array}\right\}\)| Media: | Mineral oil, non-flammable fluids, <br> environmentally safe fluids and <br> others according to O-Ring material |
| :--- | :--- |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium. Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

## Materials

## Standard Application:

- For hydraulic components with reciprocating movement in mineral oils containing zinc or medium with good lubricating performance and hard mating surface:

Seal Ring: Turcon ${ }^{\circledR}$ T46

Energizer:

O-Ring NBR 70 shore A or FKM 70 shore A (depending on the temp.)

## Special Application:

- Short stroke movements, poor lubricating fluids and soft mating surfaces.

Seal Ring: $\quad$ Turcon ${ }^{\circledR}$ T24
Energizer: $\quad$ O-Ring NBR 70 shore A or FKM 70 shore $A$ (depending on the temp.)

- For low friction requirement in dynamic hydraulic components with good lubricating medium:

| Seal Ring: | Turcon $^{\circledR}$ T05 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 shore A or FKM 70 <br>  |
| shore A (depending on the temp.) |  |

- For specific applications other material combinations as listed may also be used. Please contact your local Trelleborg Sealing Solutions sales office.

Material for the seal set:
Example:
T05 plus FKM - O-Ring T05V
T46 plus NBR - O-Ring T46N

Table XXXIV Turcon ${ }^{\circledR}$ Materials for Double Delta ${ }^{\circledR}$

## POLYPAC ${ }^{\circledR} \cdot$ BALSELE

- Single-Acting -
- Compact Seal -
- Without and with Back-up Ring -
- Material -
- Fabric-Reinforced NBR + POM -

## Balsele

## Description

The Balsele is a compact rod seal consisting of an elastomeric sealing element and an integrated fabric reinforced base.

Due to the radial pre-load, an excellent sealing performance will be achieved even at low pressures. The fabric reinforced base prevents the seal from extrusion. Where extrusion gaps are greater than those specified or for higher pressure conditions, the series B/NEI with incorporated anti-extrusion ring shall be selected.

## Design

1) Sealing element manufactured from a specially developed nitrile compound particularly resistant to compression set. The sealing lips are produced to give optimum efficiency and wear resistance.
2) The reinforced base of the seal element is of cotton fabric impregnated with nitrile elastomer and vulcanized with the sealing element 1 , thus forming an integral component.
3) Guide rings or anti-extrusion rings are made from acetal resin. As previously described, these rings maintain the seal in the optimum position for maximum performance, and minimize all possible extrusion gaps.

Please contact your local Trelleborg Sealing Solutions sales office for inch dimensions. For metric dimensions, please use the metric catalog.

## Advantages

- Small cross sections
- Good chemical resistance
- Large size range
- No hydrolyses problems
- Wide temperature range

## Application Examples

- Standard hydraulic cylinders (low to medium duty)
- Mobile hydraulic
- Water-based fluids equipment
- After market
- Presses

## Technical Data

Operating conditions
Pressure: $\quad$ Up to 3,625 psi ( 25 MPa ) (Type B)
Up to 5,800 psi ( 40 MPa ) (Type B/NEI)
Velocity: $\quad$ Up to $1.65 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$
Temperature: $\quad-22^{\circ} \mathrm{F}$ to $+266^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right.$ to $\left.+130^{\circ} \mathrm{C}\right)$
Media: Mineral oil, water, air

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

For type B:
NBR + cotton fabric
Material code N8CO
for type B/NEI:
NBR + cotton fabric
Back-up Ring material POM
Material code N8CO

## ZURCON ${ }^{\circledR}$ L.CUP ${ }^{\circledR}$

## - Single-Acting - <br> - Low-friction Zurcon ${ }^{\circledR}$ U-Cup -

## - Material . <br> - Zurcon ${ }^{\circledR}$.

## Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR}$

## Introduction

The rod sealing system is the most critical part of a hydraulic cylinder. Therefore it is expected that a rod sealing system performs under leak-free conditions in the static and dynamic state. Moreover it has to fulfill the lifetime of several thousand hours.

To meet these requirements, Trelleborg Sealing Solutions has developed the Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR *}$, a highly effective and innovative rod sealing component.
*Patent for: Europe No. EP 0724693
*Patent for: US No. 5,649,711
*Patent for: China No. ZL 94193869.7
Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR}$ is a trade name.

## Description

Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR}$ is a single acting polyurethane rod seal with a unique design offering a hydrodynamic backpumping ability over the complete working pressure range. The pressure-independent, hydrodynamic sealing ability of this new sealing element requires no lubrication reservoir in the sealing area and ensures a constant and controlled pressure distribution over a wide pressure range.
The advantages of the Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR}$ design lead to the following improved properties:

## Advantages

- Hydrodynamic back-pumping ability over the complete working pressure range
- Low friction and therefore a reduction of heat generated
- Low breakout force even after a long period of nonoperation
- Very low stick-slip
- Low increase in friction at increasing pressure
- High extrusion resistance
- Optimum geometry of the static sealing lip for higher sealing ability
- No entrapped oil and grease between seal and groove (due to notches)
- No pressure build-up between seal and groove OD
- Long service life

The Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR}$ was designed in accordance with customers' demands.

- Groove dimensions according to ISO 5597 Part 2
- Interchangeable with existing U-Cup grooves
- Installation into closed grooves
- Wear and extrusion resistant high-performance polyurethane

## Application Examples

Zurcon ${ }^{\circledR}$ L-Cup ${ }^{\circledR}$ can be used in all applications in which previously a conventional U-Cup was applied, such as:

- Fork lifts
- Agricultural machines
- Light and medium mobile hydraulics
- Industrial hydraulics
- Machine tools
- Injection molding machines

Another preferred solution for tandem rod sealing systems is the combination with the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ as primary seal and L-Cup ${ }^{\circledR}$ as secondary seal, in conjunction with a double acting scraper.

## Technical Data

Operating conditions
Pressure: $\quad$ Up to 5,800 psi ( 40 MPa )
Velocity: $\quad$ Up to $1.65 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$
Temperature: $\quad-31^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$
Media: $\quad$ Hydraulic fluids based on mineral oil

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

Please contact your local Trelleborg Sealing Solutions sales office for inch dimensions. For metric dimensions, please use the metric catalog.

## POLYPAC ${ }^{\circledR}$ VEEPAC CH/G5

- Single-Acting -
- Chevron Vee Packing Set -
- With Support and Pressure-Energizing Ring -
- Material -
- Fabric-Reinforced Rubber, Rubber, POM or PTFE -

## POLYPAC ${ }^{\circledR}$ Veepac CH/G5 Set

## Description

Veepac is a set of fabric-reinforced Chevron rings comprised of a support ring (1), sealing rings (2) and a pressure-energizing ring (3). In the packing set the energizing axial force is transferred between the individual packing rings so that each ring is pressed into positive contact with the rod surface, in addition to the standard material, special material grades are available for a large variety of working conditions. The figure shows the Veepac design.

Figure 51 Veepac design

1) " $U$ " or base rings in standard version manufactured in reinforced fabric comprised of layers of cotton impregnated with nitrile rubber compounded to resist extrusion. This component supports the Vee Rings for effective performances.
2) V-Rings are made of reinforced cotton fabric and nitrile elastomer, in standard version, to give good resilience, sealing efficiency and extrusion resistance.

Due to their specific design, Vee Rings are sensitive to fluid pressure variations, enabling them to deflect throughout their radial section, increasing the seal loading and effectiveness in proportion to the pressures applied.

2a) V-Rings are made of pure elastomer for high sealing efficienty.
3) Energizer or spreader rings are manufactured in acetal resin or PTFE. The function of this component is to ensure a uniform pressure distribution.

## Advantages

- Very robust seal
- Non sensitive
- Adjustable
- Easy replacement in the field with split rings
- Extensive range of sizes (see symmetrical seals)
- Requires non super mating surfaces

## Application Examples

- Mining equipment (with approvals)
- Excavators
- Steel mills
- Water hydraulic
- Presses
- Ship hydraulics
- Stabilizer cylinders on cranes
- Continous casting equipment

## Technical Data

Operating conditions
Pressure: Up to 5,800 psi ( 40 MPa )
Velocity: $\quad$ Up to $1.65 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$
Temperature: $-32^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ depending on material

Media: $\quad$ Hydraulic fluids
Mineral oil, water glycol, water emulsions

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

Please contact your local Trelleborg Sealing Solutions sales office for inch dimensions. For metric dimensions, please use the metric catalog.

## POLYPAC ${ }^{\circledR}$. SELEMASTER SM

# - Single-Acting - <br> - Compact Rod Seal - <br> - With Anti-Extrusion Ring - 

## - Material -

- Rubber + Fabric-Reinforced Rubber + POM -

## Selemaster SM

## Description

The rod seal range has been designed to meet the needs of hydraulic equipment operating at high pressures and subjected to severe loading and vibration conditions.
The main sealing element is manufactured in a highly compression set resistant nitrile. The most important quality of this element is the design of the multiple sealing lips for maximum sealing efficiency and end face configuration, which ensures that the Selemaster can tolerate vibrations and severe misalignment.
The support ring is made in cotton fabric reinforced nitrile elastomer. The " $U$ " shape is energized when pressure is applied.
The last element is the anti-extrusion ring manufactured in POM.

Figure 53 Selemaster design

1) POM anti-extrusion ring
2) Support ring in cotton fabric reinforced nitrile, NBR 80 Shore A
3) Sealing element in nitrile, NBR 80 Shore A

Please contact your local Trelleborg Sealing Solutions sales office for inch dimensions. For metric dimensions, please use the metric catalog.

## Note

- For low-temperature applications $-58^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}\left(-50^{\circ} \mathrm{C}\right.$ to $+110^{\circ} \mathrm{C}$ ) a special material - code N7C0 - Polypac Ref.: / 1AX -2187 is available.
- For a simple change in the field Selemaster SM in a cut version (Polypac Ref.: /1AXLS) is available on request.

## Advantages

- High sealing efficiency
- Effective sealing during vibration and shock loading
- Extrusion resistance at high pressure

## Application Examples

- Earth moving machines
- Excavators
- Lift platforms

## Technical Data

Operating conditions

| Pressure: | Up to $10,150 \mathrm{psi}(70 \mathrm{MPa})$ |
| :--- | :--- |
| Velocity: | Up to $1.65 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$ |
| Temperature: | $-40^{\circ} \mathrm{F}$ to $+266^{\circ} \mathrm{F}\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+130^{\circ} \mathrm{C}\right)$ |

## - Choice of the Sealing Element

Sealing elements have a decisive influence on the design, function and service life of hydraulic and pneumatic cylinders and systems.

This also applies to piston seals. Leak tightness, wear and gap extrusion resistance, resistance to process media and temperatures, low friction, compact form and simple installation are required to meet the demands of the industry.

The significance of these parameters and their limits depends on the requirements of the specific application. Trelleborg Sealing Solutions has developed a complete range of seals which, due to their optimized geometries and designs and the use of high-quality materials such as Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$, satisfies the technical and economic demands of the industry.

In order to be in a position to select the most appropriate seal type and material, it is necessary to first define all the desired functional parameters. Table I can then be used to make an initial selection of seals according to the specific requirements of the application.
The second column of the table contains the page number on which general information and specific design and installation instructions on the particular seal type and materials (or material combinations with multi-element seals, e.g. Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T) can be found.
Furthermore, attention is drawn to the quality of the mating surface. We recommend that the limits specified there be observed, as they have a decisive influence on the functionality and service life of the system.

The final choice of seal type and material must also take into account the detailed information on the seal elements.

Please do not hesitate to contact your local Trelleborg Sealing Solutions sales office for further information on specific applications and special technical questions.

## Notes

All multi-element standard piston seals, e.g. Glyd Ring ${ }^{\circledR}$ T, are supplied as complete seal sets. The supply includes the seal and matching elastomer energizing elements.

Designs of seals no longer contained in this catalog continue to be available. For all new applications we recommend the use of the seal types and preferred sizes (ISO series, wherever possible) listed in this catalog.
Other combinations of Turcon ${ }^{\circledR}$ materials and special designs can be developed and supplied for special applications in all intermediate sizes up to 106 inches $(2.700 \mathrm{~mm})$ diameter.

The sizes contained in this catalog are generally available from stock or can be supplied on short notice. We reserve the right to modify our supply program.

Table I Selection Criteria for Piston Seals

## Piston Seals

## Design Instructions

## Lead-in chamfers

Piston seals are always fitted with an interference fit. In order to avoid damage during installation, lead-in chamfers and rounded edges must be provided on the cylinder barrel (Figure 1). If this is not possible for design reasons, a separate installation tool must be used.
The minimum lead-in chamfer depends on the profile size of the seal and can be seen in the following tables.

Generally $\Delta \mathrm{D}_{\mathrm{N}} \mathrm{min}$. from Table II, III and IV is recommended but $\Delta \mathrm{D}_{\mathrm{N}}$ must also exceed 0.015 x bore diameter $\mathrm{D}_{\mathrm{N}}$ (relevant for big diameter cylinders).

Figure 1 Lead-in chamfer

## Piston Seals

## Surface Roughness DIN EN ISO 4287

The functional reliability and service life of a seal depends to a very great extent on the quality and surface finish of the mating surface to be sealed.
Scores, scratches, pores and concentric or spiral machining marks are not permitted. Higher demands must be made on the surface finishes of dynamic surfaces than those of static mating surfaces.

The characteristics most frequently used to describe the surface microfinish $R_{a}, R_{z}$ and $R_{\text {max }}$ are defined in DIN EN ISO 4287. These characterics alone, however, are not sufficient for assessing the suitability of seal technology. The material contact area of the surface roughness profile $\mathrm{R}_{\mathrm{mr}}$ in accordance with DIN EN ISO 4287 should be demanded. The significance of this surface specification is illustrated in Fig. 2. It shows clearly that specification of $\mathrm{R}_{\mathrm{a}}$ and $R_{z}$ alone does not describe the surface roughness profile accurately enough for the seal technology and is not sufficient for assessing the suitability. The material contact area $R_{m r}$ is essential for assessing surfaces, as this parameter is determined by the specific surface roughness profile. This depends on the machining process employed.

Trelleborg Sealing Solutions recommends that the following surface finishes be observed:

Table V Surface Roughness

| Surface Roughness $\mu$ inch |  |  |  |
| :--- | :---: | :---: | :---: |
| Parameter | Mating Surface |  | Groove <br> Surface |
|  | Turcon <br> Materials | Zurcon <br> and Rubber |  |
|  | $25-100$ | $40-160$ | $<400$ |
| $R_{z}$ DIN | $16-63$ | $25-100$ | $<63$ |
| $R_{a}$ | $2-8$ | $4-16$ |  |

The material contact area $\mathrm{R}_{\mathrm{mr}}$ should be approx. 50 to $70 \%$, determined at a cut depth $c=0.25 \times \mathrm{R}_{\mathrm{z}}$, relative to a reference line of $\mathrm{C}_{\text {ref. }} 5 \%$.

| Surface profile $\mu$ inch | $\mathrm{R}_{\mathrm{a}}$ | $\mathrm{R}_{\mathrm{z}}$ | $\mathrm{R}_{\mathrm{mr}}$ |
| :--- | :--- | :--- | :--- |
| closed profile form |  |  |  |
| open profile form | 40 | $70 \%$ |  |

Figure 2 Profile forms of surfaces

Figure 2 shows two surface profiles, both of which exhibit nearly the same value for $\mathrm{R}_{\mathrm{z}}$ in the test procedure. The difference becomes obvious only when the material contact area of the surface roughness profiles are compared. This shows that the upper roughness profile with $\mathrm{R}_{\mathrm{mr}}=70 \%$ has the better seal/mating surface ratio.

## Installation of Piston Seals

## General Installation Instructions

The following points should be observed before installation of the seals:

- Ensure the cylinder tube has a lead-in chamfer; if not, use an installation sleeve
- Deburr and chamfer or round sharp edges, cover the tips of screw threads
- Remove machining residues such as chips, dirt and other foreign particles and carefully clean all parts
- The seals can be installed more easily if they are greased or oiled. Attention must be paid to the compatibility of the seal materials with these lubricants. Use only grease without solid additives (e.g. molybdenum disulphide or zinc sulphide).
- Use no sharp-edged installation tools

## Installation in Split Grooves

Installation in split grooves is simple. The sequence of installation corresponds to the configuration of the seal. Individual seal elements must not be allowed to twist. During final installation (installation of the piston in the cylinder), elastomer or spring-preloaded seals must be sized. The corresponding cylinder barrel can be used for this purpose, provided it has a long lead-in chamfer. Alternatively, a sizing sleeve should be used.

Figure 3 Installation in a split groove

## Installation in Closed Grooves

- Without installation aids

If observing the instructions in the chapter "General installation instructions," installation of Compact Seal and Wynseal seal elements in closed grooves is relatively simple.

For Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ seals, the use of installation aids is recommended. If installation has to be performed without
installation aids, however, the following points should be observed:

Turcon ${ }^{\circledR}$ seals can be installed more easily by heating in oil or water or using a hot air fan to approx. $80^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$ $\left(176^{\circ} \mathrm{F}\right.$ to $212^{\circ} \mathrm{F}$ ) (expanding and then shrinking back to the original form).

Use no sharp edged tools to expand the seal rings.
Sizing of the seal ring is achieved with a separate sizing sleeve, or with the cylinder tube provided this has lead-in chamfers equivalent to $2 x$ the values from Table II.

Figure 4 Fitting the seal ring onto the O-Ring in the groove

Figure 5 Sizing of the installed seal

## Piston Seals

## Installation in Closed Grooves

- With installation aids

Use of a three-piece installation tool is recommended for the series production installation of Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ seal elements. The tool consists of:

- Installation sleeve
- Expanding sleeve
- Sizing sleeve

All these parts should be made of a polymer material (e.g. PA6) with good sliding characteristics and low abrasiveness to avoid damage to the seals.

In view of the wide range of sizes and the applicationspecific installation conditions, these installation tools cannot be supplied as standard by Trelleborg Sealing Solutions.

On request, however, we will gladly provide specimen drawings to allow you to manufacture these tools.

The sequence of installation is illustrated in Fig. 6 to 8. Note, however, that the installation of Turcon ${ }^{\circledR}$ seal elements should be performed quickly in order to ensure optimum recovery of the seal ring.

Figure 6 Expanding the Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$ sealing element using an expanding sleeve over the installation sleeve

Figure 7 Sealing element after snapping into the groove

Figure 8 Sizing the sealing element with sizing sleeve

## Installation of Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

Installation in closed grooves is possible from $8 \mathrm{~mm}(.315$ inches) bore diameter. For diameters smaller than 50 mm ( 1.968 inches) a loading mandrel (Fig. 9) is recommended. After installation the seal must be calibrated and this may be done with the lead-in chamfer of the cylinder tube or by means of a separate calibration sleeve.

- Turcon ${ }^{\circledR}$ piston seals can be installed more easily by heating to approx. $80^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}\left(176^{\circ} \mathrm{F}\right.$ to $212^{\circ} \mathrm{F}$ ) (expanding and then shrinking back to the original form).

Figure 9 Installation in a closed groove

## Piston Seals

## Installation of Spring-Energized Seals

Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ seals should preferably be installed in split grooves. Installation in half-open grooves is possible with a snap fitting. Figure 10 shows the design of the groove.

Figure 10 Installation in a half-open groove

Table VI Installation in Half-Open Grooves

| Series No. | $\mathbf{D}_{\mathbf{N}}$ min. | $\mathbf{Y}$ min. | $\mathbf{C}$ min. | $\mathbf{Z}$ min. |

| PVAF | 2.559 | .059 | .472 | .295 |

For further details, see chapter "Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR \text { " }}$
In exceptional cases or with existing designs, an installation in closed grooves is also possible. The details in Table VII should be regarded as guide values for installation.

Table VII Installation in closed grooves

| Series No. | $\mathbf{D}_{\mathbf{N}} \mathrm{min}$. |
| :---: | :---: |
| PVAA | 1.378 |
| PVAB | 1.968 |
| PVAC | 2.756 |
| PVAD | 4.134 |
| PVAE | 5.511 |
| PVAF | 8.661 |

## Installation of the Compact Seal

The Compact Seal can be installed in one-piece or split pistons. On one-piece pistons, the inner rubber-elastic sealing element is first installed in the middle of the groove diameter by expanding over the piston. Then the cut back-up ring is fitted on both sides of the sealing element and the two cut guide rings are installed.

On split pistons the individual parts are installed in the following order: guide ring, back-up ring, sealing element, back-up ring, guide ring.
Before installation all seal parts, including piston and cylinder, should be oiled or greased.

Piston Seals

## ZURCON ${ }^{\circledR}$ WYNSEAL

## - Double-Acting -

- O-Ring-Energized Zurcon ${ }^{\circledR}$ Slipper Seal -

## - Material - <br> - Zurcon ${ }^{\circledR}$.

## Zurcon ${ }^{\circledR}$ Wynseal

## Description

The Zurcon ${ }^{\circledR}$ Wynseal is a double-acting seal consisting of a special polyurethane seal ring and an O-Ring as energizing element (Figure 11).

The unique characteristic of the seal is the special design of the seal edge profile. Two external seal edges act as a primary seal for pressures from both sides and prevent any build-up of hydrodynamic pressure over the seal profile and the risk of the blow-by effect. The central back-up and sealing bulge increases the sealing effect *. Grooves are provided on both sides on the plane surfaces to provide activation of the energizing O-Ring. These ensure direct pressure loading of the seal under all operating conditions.
Since the installation groove is identical to that for the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$, the seal is ideal for the standardization of cylinder construction if efficient and low cost seal elements are demanded in large quantities and the cylinder can be adapted to meet different operating conditions.

Figure 11 Zurcon ${ }^{\circledR}$ Wynseal

## Advantages

- High static and dynamic sealing effect
- High abrasion resistance
- Simple groove design, one-piece piston possible
- Suitable for grooves to ISO 7425, Part 1
* Because of cross-sectional area constraints, PW10 and PW11 cross sections do not have the center support buldge.

## Application Examples

The Zurcon ${ }^{\text {® }}$ Wynseal is the recommended element for double-acting pistons of hydraulic components in various sectors such as:

- Machine tools
- Forklifts \& handling machinery
- Agriculture
- Industrial hydraulic light to medium duty

## Technical Data

| Pressure: | Up to $3,600 \mathrm{psi}(25 \mathrm{MPa}) \quad$ (Z20N) |
| :--- | :--- |
| Velocity: | Up to $1.65 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$ |
| Temperature: | $-31^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$ |
| Media: | Mineral oil-based hydraulic fluids |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

## Standard Materials:

$\begin{array}{ll}\text { Seal ring: } & \text { Zurcon }{ }^{\circledR} \text { Z20, } 93 \text { Shore A } \\ \text { O-Ring: } & \text { NBR 70 Shore A }\end{array}$

## Installation Recommendation (Inch Piston Series)

Figure 12 Installation drawing

1) Tolerances used are per ISO-286; ISO System of Limits and Fits. The tolerances are converted from metric and rounded to the nearest three place decimal.
2) The groove diameter h9 tolerance is recommended per ISO-286; ISO System of Limits and Fits. The tolerances are converted from metric and rounded to the nearest three place decimal.
3) The clearance stated as $S$ in the above table are for when the seal is specified with Slydring ${ }^{\circledR}$ bearings. When not incorporating Slydring ${ }^{\circledR}$ bearings, the radial clearance should be reduced.
4) To determine minimum piston diameter $D$, subtract the diametral clearance ( $2 \times S$ ) from maximum bore diameter $D_{N}$.
5) Consult your Trelleborg Sealing Solutions sales office for diameters that exceed those listed in the above table.

## TURCON ${ }^{\circledR}$ GLYD RING $^{\circledR}{ }^{\top}$

## - Double-Acting -

## - O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -

## - Material -

- Turcon ${ }^{\circledR}$, Zurcon ${ }^{\circledR}$ and Elastomer -

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathbf{T}^{*}$

## Description

The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T is a further technical development of the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ seal, which has been successfully used for decades. It is fully interchangeable with the earlier Glyd Ring ${ }^{\circledR}$ seals in all new applications. The Glyd Ring ${ }^{\circledR} \mathrm{T}$ meets all the market demands for a function-specific sealing solution, observing economic and ecological aspects.
The benefits of the patented seal concept are provided by the innovative functional principle of the trapezoidal profile cross-section.

Both lateral profile flanks are inclined so that the seal profile tapers towards the seal surface. The profile can thus retain the robust and compact form typical of piston seals without losing any of the flexibility required to achieve a pressure-related maximum compression (Figure 13).

Figure 13 Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T
The edge angle created by the special Glyd Ring ${ }^{\circledR}$ T crosssectional form permits an additional degree of freedom and enables a slight tilting movement of the seal. The maximum compression is always shifted towards the area of the seal edge directly exposed to the pressure. On the low-pressure edge of the seal the Glyd Ring ${ }^{\circledR}$ T exhibits only zones with neutral strains without compressive or shearing loads, effectively reducing the danger of gap extrusion. The resulting benefits for the user can be seen in the following list.

## Advantages

The benefits offered by the Glyd Ring ${ }^{\circledR}$ remain and are now complemented by these further advantages:

- Very good static leak-tightness
- Increased clearance possible (approx. +50\%), depending on the operating conditions
- Due to the larger extrusion gap, safe use even with soiled media
- Low friction, no stick-slip effect
- Simple groove design, one-piece pistons possible
- Adaptable to the operating conditions due to a wide range of possible materials (Turcon ${ }^{\circledR}$, Zurcon ${ }^{\circledR}$ )
- Suitable for new environmentally safe hydraulic fluids
- Available for all cylinder diameters up to 106 inches (2,700 mm)

## Application Examples

The Turcon ${ }^{\circledR}$ Glyd Ring $^{\circledR} \mathrm{T}$ is the recommended sealing element for double-acting pistons of hydraulic components such as:

- Injection molding machines
- Machine tools
- Presses
- Excavators
- Forklifts \& handling machinery
- Agriculture machinery
- Valves for hydraulic \& pneumatic circuits

It is particularly recommended for heavy duty and large diameter applications.

Single-acting hydraulic cylinder
Test conditions: HLP 46, 80C, Pressure cycle $0 / 30 \mathrm{MPa}$
( 4.350 psi ), piston moving in pressure direction

Figure 14 Dynamic leakage Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T/ Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ as single-acting piston seal

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T

## Technical Data

Operating conditions

| Pressure: | Up to $11,600 \mathrm{psi}(80 \mathrm{MPa})$ |
| :--- | :--- |
| Velocity: | Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$ |
| Temperature: | $-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.\left.+200^{\circ} \mathrm{C}\right) *\right)$  <br>  (depending on O-Ring material) |

Media: Mineral oil-based hydraulic fluids, barely flammable hydraulic fluids, environmentally safe hydraulic fluids (bio-oils), water, air and others, depending on the O-Ring material (see Table X)

The maximum permissible radial clearance $s_{\text {max }}$ is shown in Table XI, as a function of the operating pressure and functional diameter.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.
*) In the case of unpressurized applications in temperatures below $32^{\circ} \mathrm{F}\left(0^{\circ} \mathrm{C}\right)$ please contact our application engineers for assistance!

## Materials

## Standard Application:

- For hydraulic components with reciprocating movement in mineral oils containing zinc or medium with good lubricating performance

| Seal ring: | Turcon $^{\circledR}$ T46 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set reference: | T46N or T46V |

## Special Application:

- Non-lubricating fluids or pneumatic applications require self-lubricating sealing materials. Therefore we recommend:

Seal ring:

| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| :--- | :--- |
| Set reference: | T40N or T40V |

- If rougher surface finish must be sealed, we recommend:

| Seal ring: | Zurcon $^{\circledR}$ Z51 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A |
| Set reference: | Z51N |

## Ordering example

Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ T, complete with O-Ring, standard application, series PT12 (from Table XI)
Bore diameter: $\quad \mathrm{D}_{\mathrm{N}}=3.000$ inches
TSS Part No.: PT1203000 (from Table XII)
Select the material from Table X. The corresponding code numbers are appended to the TSS Part No. (from Table XII). Together they form the TSS Article No.
For all intermediate sizes not shown in Table XII, the TSS Article No. can be determined from the example opposite.

*** For diameters $\geq 100.000$ inches please consult your Trelleborg Sealing Solutions sales office for special part no.

## ZURCON ${ }^{\circledR}$ GLYD RING ${ }^{\circledR}$ P (ISO)

- Double-Acting -
- Elastomer-Energized Zurcon ${ }^{\circledR}$ Slipper Seal -

## - Materials - <br> - Zurcon ${ }^{\circledR}$.

## Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ P (ISO)

## Description

The double-acting Zurcon ${ }^{\circledR}$ Glyd Ring $^{\circledR} \mathrm{P}$ is a combination of a Zurcon ${ }^{\circledR}$-based slipper seal with a step cut and an energizing rectangular elastomeric ring. It is produced with an interference fit at closed step cut which together with the squeeze of the rectangular energizer ring ensures a good sealing effect even at low pressure.

At higher system pressures, the rectangular ring is energized by the fluid, pushing the Zurcon ${ }^{\circledR}$ Glyd Ring $^{\circledR} P$ against the sealing face with increased force. At high peak pressures, the Zurcon ${ }^{\circledR}$ step cut seal ring can follow ballooning of the tube without losing the sealability.

Due to the Zurcon ${ }^{\circledR}$ high strength plastic material, two times bigger extrusion gaps are possible compared with Turcon ${ }^{\circledR}$ materials. The step cut in the ring is necessary for installation in closed grooves and for the flexibility of the seal ring due to the high stiffness of the material.

Figure 16 Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} P$

## Step Cut

For easy installation on the piston and for the flexibility of the seal ring a precision step cut is produced by special tool technology.

Figure 17 Step cut on Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ P

## Advantages

- Easy installation on piston without special tools
- Due to large extrusion gap, safe use even with soiled media
- Installation grooves acc. to ISO 7425/1
- Simple groove design, one piece piston possible
- Increased clearance compared to Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ seals (approx. $+50 \%$ ), depending on operation conditions
- Resistent against shock loads
- High wear resistant material ensures long service life

## Application Examples

- Telescopic cylinders
- Construction machinery, e.g. excavators
- Truck cranes
- Fork lifts

It is particularly recommended for heavy duty applications

## Technical Data

Operating conditions:
The Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} P$ is recommended for reciprocating (with a length of stroke at least twice the groove width) movements where the dimensional gap between piston and tube is as big as possible or where high pressure peaks occur during operation.

The sizes listed in bold font are preferred sizes (more likely to be available for immediate shipment). Other dimensions and all intermediate sizes up to 10 inches ( 254 mm ) diameter can be supplied.

## TURCON ${ }^{\circledR}$ GLYD RING ${ }^{\circledR}$

- Double-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$

## Description

Successfully used for decades, the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ is a very effective and reliable low frictional seal. It is particularly suitable as a piston seal in both high and low pressure systems.
The double-acting Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ is a combination of a Turcon ${ }^{\circledR}$-based slipper seal and an energizing O-Ring. It is produced with an interference fit which together with the squeeze of the O-Ring ensures a good sealing effect even at low pressure. At higher system pressures, the O-Ring is energized by the fluid, pushing the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ against the sealing face with increased force.

Figure 23 Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$
The geometry of the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ ensures a good static sealing and allows the lubricating hydrodynamic oil film to be built under the seal in reciprocating applications.

## Notches

To assure that a rapid energizing of the seal takes place at sudden changes of pressure and direction of motion, radial notches are machined on both sides of the seal.

Figure 24 Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ with notches

Notches are available and recommended on the Glyd Ring ${ }^{\circledR}$ series by changing the third digit to an "N". See ordering example.

## Advantages

- No stick-slip effect when starting for smooth operation
- Minimum static and dynamic friction coefficient for a minimum energy loss and operating temperature
- Suitable for non-lubricating fluids depending on seal material for optimum design flexibility
- High wear resistance ensures long service life
- No adhesive effect to the mating surface during long period of inactivity or storage
- Suitable for most hydraulic fluids in relation to most modern hardware materials and surface finishes depending on material selected
- Suitable for new environmentally safe hydraulic fluids
- Available for all cylinder diameters up to 106 inches ( $2,700 \mathrm{~mm}$ )

## Application Examples

Over several decades the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ has been successfully implemented as a double-acting piston seal for hydraulic components. Examples include:

- Injection molding machines
- Machine tools
- Presses
- Excavators
- Forklifts \& handling machinery
- Agriculture equipment
- Valves for hydraulic \& pneumatic circuits

## Technical Data

Operating conditions:
The Turcon ${ }^{\circledR}$ Glyd Ring $^{\circledR}$ is recommended for reciprocating (with a length of stroke at least twice the groove width) and helical movements.
$\left.\begin{array}{ll}\text { Pressure: } & \text { Up to } 11,600 \mathrm{psi}(80 \mathrm{MPa}) \\ \text { Velocity: } & \text { Up to } 50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s}) \\ \text { Frequency: } & \text { Up to } 5 \mathrm{~Hz} . \\ \text { Temperature: } & \begin{array}{l}-49^{\circ} \mathrm{F} \text { to }+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C} \text { to }+200^{\circ} \mathrm{C}\right) * \text { *) } \\ \text { (depending on O-Ring material) }\end{array} \\ \text { Media: } & \begin{array}{l}\text { Mineral oil-based hydraulic fluids, } \\ \text { barely flammable hydraulic fluids, } \\ \text { environmentally safe hydraulic fluids } \\ \text { (biological degradable oils), water, } \\ \text { air and others. This depends on the }\end{array} \\ \text { O-Ring material compatibility. }\end{array}\right\}$

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.
*) In the case of unpressurized applications in temperatures below $32^{\circ} \mathrm{F}\left(0^{\circ} \mathrm{C}\right)$ please contact our application engineers for assistance!

## Materials

## Standard Applications:

- For hydraulic components in mineral oils containing zinc or medium with good lubricating performance

Seal ring: Turcon ${ }^{\circledR}$ T 46

Energizer: $\quad$ O-Ring NBR 70 shore A or FKM 70 Shore A depending on the temperature
Seal ring. Turcon 146

| Energizer: | O-Ring NBR 70 shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| :--- | :--- |

[^11]
## Special Applications: <br> Special Applications:

- Short stroke movements, non-lubricating fluids or pneumatic applications require self-lubricating sealing materials. Therefore we recommend:

| Seal ring: | Turcon $^{\circledR}$ T29 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set reference: | T29N or T29V |

- If low friction coefficient is required, we recommend:

Seal ring: Turcon ${ }^{\circledR}$ T 05

Energizer: $\quad$ O-Ring NBR 70 Shore A or FKM 70 Shore A depending on the temperature. For special requirements other elastomers are available on request

Set reference: T05N or T05V

- If rougher surface finish must be sealed, we recommend:

| Seal ring: | Zurcon $^{\circledR}$ Z51 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A |
| Set reference: | Z51N |

The sizes listed in bold font are preferred sizes (more likely to be available for immediate shipment). Other dimensions and all intermediate sizes up to 106 inches ( 2700 mm ) diameter can be supplied.

## TURCON ${ }^{®}$ GLYD $^{\text {RING }}{ }^{\circledR}{ }^{\circledR}$

- Double-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Materials -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Glyd Ring C

## Description

Successfully used for decades, the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ is a very effective and reliable low frictional seal. It is particularly suitable as a piston seal in both high and low pressure systems.
The double-acting Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ is a combination of a Turcon ${ }^{\circledR}$-based slipper seal and an energizing O-Ring. It is produced with an interference fit which, together with the squeeze of the O-Ring, ensures a good sealing effect even at low pressure. At higher system pressures, the O-Ring is energized by the fluid, pushing the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ against the sealing face with increased force.

Figure 26 Turcon $^{\circledR}$ Glyd Ring $^{\circledR} \mathrm{C}$
The geometry of the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ ensures a good static sealing and allows the lubricating hydrodynamic oil film to be built under the seal in reciprocating applications.

## Notches

To assure that a rapid energizing of the seal takes place at sudden changes of pressure and direction, radial notches are machined on both sides of the seal.

Figure 27 Turcon $^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{C}$ with notches on both sides

## Advantages

- No stick-slip effect when starting for smooth operation
- Minimum static and dynamic friction coefficient for minimum energy loss and operating temperature
- Suitable for non-lubricating fluids depending on seal material for optimum design flexibility
- High wear resistance ensures long service life
- No adhesive effect to the mating surface during long period of inactivity or storage
- Suitable for most hydraulic fluids in relation with most modern hardware materials and surface finishes depending on material selected
- Suitable for new environmentally safe hydraulic fluids

## Application Examples

Over several decades the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ has been successfully implemented as a double-acting piston seal for hydraulic components. Applications include:

- Machine tools
- Robotics
- Handling machinery
- Manipulators
- Valves for hydraulic \& pneumatic circuits
- Fittings
- Testing machinery
- Hydraulic power steering
- Brake systems
- Brake boosters
- Low temperature hydraulics
- Chemical processing equipment
- Filling machines

## Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C

## Technical Data

Operating conditions:
The Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ C is recommended for reciprocating movements (with a length of stroke at least twice the groove width).

Pressure:
5,800 psi (40 MPa) standard
Velocity:
Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$
Frequency:
Up to 5 Hz
Temperature: $\quad-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$
Media:

Clearance:
Mineral oil-based hydraulic fluids, barely flammable hydraulic fluids, environmentally safe hydraulic fluids (biological degradable oils), water, air and others, depending on the O-Ring material compatibility.

The maximum permissible radial clearance Smax, as shown in the table III, as a function of the operating pressure and functional diameter.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

## Standard Application:

For hydraulic components in mineral oils containing or medium with good lubricating performance

| Seal ring: | Turcon $^{\circledR}$ T 46 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set code: | T46N or T46V |

## Special Application:

Short stroke movements, non-lubricating fluids or pneumatic applications require self-lubricating sealing materials. Therefore we recommend:

| Seal ring: | Turcon $^{\circledR}$ T 40 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set code: | T40N or T40V |

If low friction coefficient is required, we recommend:

| Seal ring: | Turcon $^{\circledR}$ T05 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature. <br> For special requirements other <br> elastomers are available upon <br> request |
| Set code: | T05N or T05V |

If rougher surface finish must be sealed, we recommend:

| Seal ring: | Zurcon $^{\circledR}$ Z51 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A |
| Set code: | Z51N |

If exposure to water is required, we recommend:
Seal ring: $\quad$ Zurcon ${ }^{\circledR}$ Z80
Energizer: $\quad$ O-Ring NBR 70 Shore A
Set code: Z80N

For pneumatics applications we recommend a specific pneumatic version, the Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ APG, which fits the same groove dimensions. This series has a reduced O-Ring squeeze adapted to this function.

Table XX Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ Materials for Glyd Ring ${ }^{\text {® }}$

## - Materials - <br> - Zurcon ${ }^{\circledR}$.

## Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ P

## Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ P

## Description

The double-acting Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} P$ is a combination of a Zurcon ${ }^{\circledR}$-based slipper seal with a step cut and an energizing rectangular elastomeric ring. It is produced with an interference fit at closed step cut which together with the squeeze of the rectangular energizer ring ensures a good sealing effect even at low pressure.

At higher system pressures, the rectangular ring is energized by the fluid, pushing the Zurcon ${ }^{\circledR}$ Glyd Ring $^{\circledR} \mathrm{P}$ against the sealing face with increased force. At high peak pressures, the Zurcon ${ }^{\circledR}$ step cut seal ring can follow ballooning of the tube without losing the sealability.

Due to the Zurcon ${ }^{\circledR}$ high strength plastic material, two times bigger extrusion gaps are possible compared with Turcon ${ }^{\circledR}$ materials. The step cut in the ring is necessary for installation in closed grooves and for the flexibility of the seal ring due to the high stiffness of the material.

Figure 30 Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{P}$
Step Cut
For easy installation on the piston and for the flexibility of the seal ring a precision step cut is produced by special tool technology.

Figure 31 Step cut on Zurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} P$

## Advantages

- Easy installation on piston without special tools
- Due to large extrusion gap, safe use even with soiled media
- Simple groove design, one piece piston possible
- Increased clearance compared to Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$ seals (approx. $+50 \%$ ), depending on operation conditions
- Resistant against shock loads
- High wear resistant material ensures long service life

## Application Examples

- Telescopic cylinders
- Construction machinery, e.g. excavators
- Truck cranes
- Fork lifts

It is particularly recommended for heavy duty applications

## Technical Data

Operating conditions:
TheZurcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{P}$ is recommended for reciprocating (with a length of stroke at least twice the groove width) movements where the dimensional gap between piston and tube is as big as possible or where high pressure peaks occur during operation.

| Pressure: | $7,250 \mathrm{psi}(50 \mathrm{MPa})$ standard  <br>  $14,500 \mathrm{psi}(100 \mathrm{MPa})$ pressure peak |
| :--- | :--- |
| Velocity: | Up to $3.3 \mathrm{ft} / \mathrm{s}(1 \mathrm{~m} / \mathrm{s})$ |
| Temperature: | $-22^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$ |
|  | $-40^{\circ} \mathrm{F}$ to $+212^{\circ} \mathrm{F}\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+100^{\circ} \mathrm{C}\right)$ |
|  | $-5^{\circ} \mathrm{F}$ to $+284^{\circ} \mathrm{F}\left(-15^{\circ} \mathrm{C}\right.$ to $\left.+140^{\circ} \mathrm{C}\right)$ |
|  | Mineral oil-based hydraulic fluids |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

## Materials

## TURCON ${ }^{\circledR}$ STEPSEAL ${ }^{\circledR} 2 \mathrm{~K}$

- Single-Acting -
- O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Material -

Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$

## Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR}$ 2K

## Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR}$ 2K ${ }^{*}$

## Description

The Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ is a single-acting seal element consisting of a seal ring of high-grade Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$ materials and an O-Ring as an energizing element.

The Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ was originally developed and patented by Trelleborg Sealing Solutions as a rod seal. Due to its outstanding properties, however, it is equally well suited as a single-acting piston seal where high demands are made on positional accuracy and free movement.

Figure 34 Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$

## Advantages

- High static and dynamic sealing effect
- Stick-slip-free operation for precise control
- High abrasion resistance and high resistance to extrusion
- Long service life
- Simple groove design, one-piece piston possible
- Wide range of application temperatures and high resistance to chemicals, depending on the choice of O-Ring material
- Simple installation without seal edge deformation
- Available for all diameters up to 106 inches ( $2,700 \mathrm{~mm}$ )
- Low friction
* Patented and patent pending geometry

## Application Examples

The Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$ is the recommended sealing element for single-acting pistons in hydraulic components for:

- Injection molding machines
- Machine tools
- Presses

It is particularly recommended in floating piston accumulators as the primary seal on the oil side in combination with AQ-Seal ${ }^{\circledR}$ and AQ-Seal ${ }^{\circledR} 5$.

## Technical Data

Operating conditions
Pressure: Up to 11,600 psi ( 80 MPa )
Velocity: $\quad U p$ to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$,
frequency up to 5 Hz
Temperature: $\quad-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.\left.+200^{\circ} \mathrm{C}\right){ }^{* *}\right)$
Media: Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids, environmentally safe hydraulic fluids (bio-oils), water, air and others, depending on the O-Ring material (see Table XXV)

Clearance: The maximum permissible radial clearance $S_{\text {max }}$ is shown in Table XXVI, as a function of the operating pressure and functional diameter.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.
**) in the case of unpressurized applications in temperatures below $32{ }^{\circ} \mathrm{F}\left(0^{\circ} \mathrm{C}\right)$ please contact our application engineers for assistance!

## Materials

## Standard Application:

- For hydraulic components in mineral oils containing zinc or medium with good lubricating performance

| Seal ring: | Turcon ${ }^{\circledR}$ T46 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set reference: | T46N or T46V |

## Special Application:

- Non-lubricating fluids or pneumatic applications require self-lubricating sealing materials.
Therefore we recommend:

| Seal ring: | Turcon $^{\circledR}$ T29 |
| :--- | :--- |
| Energizer: | O-Ring NBR 70 Shore A or FKM 70 <br> Shore A depending on the <br> temperature |
| Set reference: | T29N or T29V |

- Rough mating surface finish and improved leakage control

Seal ring: $\quad$ Zurcon ${ }^{\circledR}$ Z51
Energizer: O-Ring NBR 70 Shore A

The sizes listed in bold font are preferred sizes (more likely to be available for immediate shipment). Other dimensions and all intermediate sizes up to 106 inches ( 2700 mm ) diameter can be supplied.

## TURCON ${ }^{\circledR}$ DOUBLE DELTA ${ }^{\circledR}$

## - Double-Acting -

## - O-Ring-Energized Turcon ${ }^{\circledR}$ Slipper Seal -

## - Material - <br> - Turcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

## Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

## Description

The Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$ is a rubber-energized plastic faced seal. The seal is designed to expand and improve the service parameters of O-Rings and is installed in existing O-Ring grooves.
The Double Delta ${ }^{\circledR}$ combines the flexibility and response of O-Rings with the wear and friction characteristics of the Turcon ${ }^{\circledR}$ materials in dynamic applications.

The figure below shows the cross section of the Double Delta ${ }^{\circledR}$.

The double-acting performance of the seal comes from the symmetrical cross section which allows the seal to respond to pressure in both directions.
Initial contact pressure is provided by radial compression of the O-Ring. When the system pressure is increased the O-Ring transforms this into additional contact pressure, the contact pressure of the seal is thereby automatically adjusted so sealing is ensured under all service conditions.

Figure 36 Turcon $^{\circledR}$ Double Delta ${ }^{\circledR}$ without and with pressure

## Advantages

- Compact groove dimensions and simple installation
- Low friction without stick-slip
- Resistance against wear and extrusion
- Piston seals available for all diameters from . 25 to 40 inches ( 5 to 999.9 mm )
- Standard cross sections cover AS 568A and important metric O-Rings, other cross sections available on request.

## Application Examples

The Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$ is the recommended sealing element for double-acting pistons of hydraulic or pneumatic cylinders in sectors such as:

- Machine tools
- Handling devices
- Manipulators
- Valves
- Chemical process equipment

It is particularly recommended for light duty and small diameter applications.

## Technical Data

Operating conditions

| Pressure: | Up to $5,000 \mathrm{psi}(35 \mathrm{MPa})$ |
| :--- | :--- |
| Velocity: | Up to $50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$ |
| Temperature: | $-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ <br>  <br>  <br> (according to O-Ring material) |
| Media: | Mineral oil, <br>  <br> Non-flammable fluids, <br> Environmentally safe fluids and <br> others according to O-Ring material |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

## Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$

## ■ Materials

## Standard Application:

- For hydraulic components with reciprocating movement in mineral oils containing zinc or medium with good lubricating performance and hard mating surface

Seal ring:
Energizer:

Turcon ${ }^{\circledR}$ T46
O-Ring NBR 70 Shore A or FKM 70 Shore A depending on the temperature

## Special Application:

- Short stroke movements, poor lubricating fluids and soft mating surfaces

Seal ring:

$$
\text { Turcon }{ }^{\circledR} \mathrm{T} 24
$$

Energizer:
O-Ring NBR 70 shore A or FKM 70 shore A (depending on the temp.)

- For low friction requirement in dynamic hydraulic components with good lubricating medium:
Seal ring:
Turcon ${ }^{\circledR}$ T05
Energizer:
O-Ring NBR 70 shore A or FKM 70 shore A (depending on the temp.)
- For specific applications other material combinations as listed may also be used. Please contact your local Trelleborg Sealing Solutions sales office.

Material for the seal set:

| Example: | T05 plus FKM - O-Ring | T05V |
| :--- | :--- | :--- |
|  | T46 plus NBR - O-Ring | T46N |

## ■ Design Instructions

## Lead-in Chamfers

In order to avoid damage to the seal during installation, lead-in chamfers and rounded edges must be provided on the bore or piston rod (Figure 27).

The minimum length of the lead-in chamfer depends on the profile size of the seal and can be seen from the following tables.

Table XXVIII Lead-in Chamfers

| Lead-in Chamfer* <br> Diameter increase $\Delta \mathbf{D}_{\mathrm{N}}$ <br> min. | O-Ring Cross Section** <br> $\mathbf{d}_{\mathbf{2}}$ |
| :---: | :---: |
| .055 | $.070-.078$ |
| .071 | $.094-.103$ |
| .094 | $.118-.157$ |
| .126 | $.196-.224$ |
| .157 | $.275-.331$ |

* Though not less than $1.5 \%$ of service diameter (bore/piston diameter).
** The O-Ring cross section $\mathrm{d}_{2}$ can be found in the appropriate tables "Installation Dimensions", XXX, XXX and XXXI.

L1 is for "0" Back-up groove width - PD00_B series
L2 is for " 1 " Back-up groove width - PD01_B series

## Ordering example

Turcon ${ }^{\circledR}$ Double Delta ${ }^{\circledR}$, complete with O-Ring, standard range, series PD00 (from Table XXX)
Dash size: 117
TSS Part No.: PD000B117 (from Table XXXI)
Select the material from Table XXIX. The corresponding code numbers are appended to the TSS Part No. (from Table XXXI). Together they form the TSS Article No.
For all intermediate sizes not shown in Table XXXI, the TSS Article No. can be determined from the example opposite.

## Notes:

1) Tolerances used are per ISO-286; ISO System of Limits and Fits. The tolerances are converted from metric and rounded to the nearest three place decimal.
2) The clearance stated as $S$ in the table $X X X$ is for when the seal is specified with Slydring bearings. When not incorporating Slydring bearings, the diametral clearance should be reduced.

Table XXXI Installation dimensions/TSS Part No.

## TURCON ${ }^{®}$ CST SEAL

- Double-Acting -
- Elastomer-Energized Turcon ${ }^{\circledR}$ Slipper Seal -
- Material -
- Turcon ${ }^{\circledR}$ and POM .

## Turcon ${ }^{\circledR}$ CST Seal

## Description

The CST Seal is a high-pressure heavy-duty piston seal with excellent leakage control and superior extrusion and wear resistance
The CST seal is a combination of a Turcon ${ }^{\text {® }}$-based slipper seal energized by an elastomer profile ring and completed with two Back-up rings (Zurcon ${ }^{\circledR}$ ). It is manufactured with a predefined interference fit, which together with the squeeze of the elastomer part ensures a good sealing effect even at low system pressure. At higher pressures the elastomer part is energized by the system pressure and activates the slipper seal in the radial direction.

The back-up rings prevent the slipper seal from extrusion and ensure a long service life even under harsh conditions.

Figure 40 CST Seal

## Advantages

- Simple groove design
- No stick-slip effect when starting for smooth operation
- Minimum static and dynamic coefficient of friction
- Increased clearance possible
- Due to larger extrusion gap, safe use even with soiled media
- Long service life

## Application Examples

The CST Seal is the recommended sealing element for double-acting pistons of hydraulic cylinders working in very harsh conditions such as:

- Excavators
- Heavy duty hydraulic cylinders

## Technical Data

Operating conditions
Pressure: Up to 11,600 psi ( 80 MPa )
Peak pressure up to 19,500 psi ( 135 MPa )
Velocity: $\quad$ Up to $5 \mathrm{ft} / \mathrm{s}(1.5 \mathrm{~m} / \mathrm{s})$
Temperature: $-49^{\circ} \mathrm{F}$ to $+275^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+135^{\circ} \mathrm{C}\right)$
Media: Mineral oil based hydraulic fluids, water/oil and glycol/oil emulsions

Clearance: The maximum permissible radial clearance $S_{\text {max }}$ is shown in Table XXXV, as a function of the operating pressure and functional diameter.

## Materials

## Standard Application:

For hydraulic components:

- In mineral oils or medium with good lubricating performance

| Seal ring: | Turcon ${ }^{\circledR}$ T46 |

|  |  | FKM-70 Shore A | V | -14 to +392 |  |  |

* The O-Ring operation temperature is only valid in mineral hydraulic oil. ** Material not suitable for mineral oils. BAM: Tested by "Bundes Anstalt Materialprüfung, Germany". $\square$ Highlighted materials are standard.

## Installation Recommendation

Figure 41 Installation drawing

1) The bore diameter H 9 tolerance is recommended per ISO-286; ISO System of Limits and Fits. The tolerances are coverted from metric and rounded to the nearest three place decimal.
2) The groove diameter h9 tolerance is recommended per ISO-286; ISO System of Limits and Fits. The tolerances are converted from metric and rounded to the nearest three place decimal.
3) The clearances stated as $S$ in the above table are for the Turcon ${ }^{\circledR}$ CST Seal when specified with Slydring ${ }^{\circledR}$ bearings. When not incorporating Slydring ${ }^{\circledR}$ bearings, the diametral clearance should be reduced.
4) To determine minimum piston diameter $D$, subtract diametral clearance from the maximum bore.
5) Consult your sales office for diameters that exceed those listed in the above table.

Table XXXIV Installation recommendation

The sizes listed in bold font are preferred sizes (more likely to be available for immediate shipment). Other dimensions and all intermediate sizes up to 106 inches ( 2700 mm ) diameter can be supplied.

## TURCON ${ }^{\circledR}$ AQ-SEAL ${ }^{\circledR}$

- Double-Acting -
- O-Ring-Energized Slipper Seal Elastomer Contact -
- Material -
- Turcon ${ }^{\circledR}$ and Elastomer -

## Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR}$

## Description

The Turcon ${ }^{\circledR} \mathrm{AQ}-\mathrm{Seal}{ }^{\circledR}$ is a double-acting seal consisting of a seal ring of high-grade modified Turcon ${ }^{\circledR}$ material, an X-ring Seal and an O-Ring as an energizing element.

The Turcon ${ }^{\circledR}$ seal ring and the X -ring Seal together assume the dynamic sealing function while the O-Ring performs the static sealing function.

Figure 42 Turcon ${ }^{\circledR} \mathrm{AQ}$-Seal ${ }^{\circledR}$

## Advantages

- High sealing effect in applications requiring media separation, e.g. fluid/fluid or fluid/gas
- Double security through the combination of low-friction special materials with elastomer seals
- Simple groove design, small installation space, interchangeable with Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR}$, Turcon ${ }^{\circledR}$ Glyd Ring ${ }^{\circledR} \mathrm{T}$ and Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} \mathrm{K}$ installation according to ISO 7425/1
- Outstanding sliding properties, no stick-slip effect

## Application Examples

The Turcon ${ }^{\circledR} \mathrm{AQ}$-Seal ${ }^{\circledR}$ is the recommended sealing element for double-acting pistons of accumulators and positioning and holding cylinders for:

- Machine tools
- Presses
- Accumulators
- Stabilizers
- Heavy duty suspension cylinders

## Technical Data

Operating
pressure: $\quad 5,800 \mathrm{psi}(40 \mathrm{MPa})$

Velocity: $\quad$ Up to $6.5 \mathrm{ft} / \mathrm{s}(2 \mathrm{~m} / \mathrm{s})$
Temperature: $-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ *)
(depending on O-Ring and X-ring Seal material)
(For applications at low temperatures below $-22^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right)$, please contact us).

Media: For all common hydraulic fluids, including bio-oils and gases

Clearance: The maximum permissible radial clearance $\mathrm{S}_{\text {max }}$ is shown in Table XXXVII, as a function of the operating pressure and functional diameter.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.
*) In the case of unpressurized applications in temperatures below $32{ }^{\circ} \mathrm{F}\left(0^{\circ} \mathrm{C}\right)$ please contact our application engineers for assistance!

Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR}$

## Materials

## Standard Application:

- For hydraulic components in mineral oils or medium with good lubricating performance
- Mineral oils and gases

Seal ring: $\quad$ Turcon ${ }^{\circledR}$ T46
Energizer: $\quad$ O-Ring and X-ring Seal in NBR 70 Shore A (code N)

## Special Application:

For special applications requiring other material combinations, please contact your local Trelleborg Sealing Solutions sales office.

Table XXXVI Turcon ${ }^{\circledR}$ Materials for Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR}$

| Material, Applications, Properties | Code | O-Ring Material | Code | O-Ring Operating Temp.* ${ }^{\circ} \mathrm{F}$ | Mating Surface Material | PSI <br> Max. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Ordering example

Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR}$, complete with O-Ring and X-Ring Seal, recommended range, Series PQE1 (from Table XXXVII)

Bore diameter: $\quad D_{N}=4.000$ inches TSS Part No.

PQE104000 (from Table XXXVIII)

Select the material from Table XXXVI. The corresponding code numbers are appended to the TSS Part No. (from Table XXXVIII). Together they form the TSS Article No.
For all intermediate sizes not shown in Table XXXVIII, the TSS Article No. can be determined from the example opposite.

Table XXXVIII Installation dimensions / TSS Part No

## TURCON ${ }^{\circledR}$ AQ-SEAL ${ }^{\circledR} 5$

- Double-Acting -
- O-Ring-Energized Slipper Seal Elastomer Contact -
- Material -
- Turcon ${ }^{\circledR}$ and Elastomer -

## Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR} 5$

## Description

The Turcon ${ }^{\circledR} \mathrm{AQ}-\mathrm{Seal}{ }^{\circledR} 5$ is a patented development of the proven standard Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR}$.

The seal profile of the Turcon ${ }^{\circledR}$ ring has been redesigned on both the dynamic and static sealing surfaces. Two O-Rings are used to energize the seal instead of one.

Figure 44 Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR} 5$
The AQ-Seal ${ }^{\circledR} 5$ combines the benefits of a low-friction Turcon ${ }^{\circledR}$ slipper seal with the high sealing characteristics of an elastomeric seal by incorporating a limited foot print Xring Seal in the dynamic sealing face. This optimizes leakage control while minimizing friction.
The unique characteristics of the AQ-Seal ${ }^{\circledR} 5$ are the special seal profile with a defined seal edge and the use of two O-Rings as energizing elements to optimize the pressure profile and to reduce the force of attack at gas permeability.

## Advantages

- High sealing effect in applications requiring media separation, e.g. fluid/fluid or fluid/gas
- Double security through the combination of low-friction special materials with elastomer seals
- Low gas permeation rate
- Higher pressure application, higher sliding speed compared to the AQ-Seal ${ }^{\text {® }}$
- Outstanding sliding properties, no stick-slip effect

## Application Examples

The Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR} 5$ is the recommended sealing element for double acting pistons of accumulators and positioning and holding cylinders for:

- Machine tools
- Presses
- Rolling mills
- Offshore
- Accumulators
- Heavy duty suspension cylinders

It is particularly recommended for heavy duty and large diameter applications.

## Technical Data

Operating conditions
Pressure: $\quad 8,700 \mathrm{psi}(60 \mathrm{MPa})$
Velocity: $\quad U p$ to $10 \mathrm{ft} / \mathrm{s}(3 \mathrm{~m} / \mathrm{s})$
Temperature: $\quad-22^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right.$ to $\left.\left.+200^{\circ} \mathrm{C}\right) * *\right)$
(depending on O-Ring and X-ring Seal material)
(For applications at low temperatures below $-22^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right)$, please contact us).

Media: For all common hydraulic fluids, including bio-oils and gases

Clearance: The maximum permissible radial clearance $S_{\text {max }}$ is shown in Table XL, as a function of the operating pressure and functional diameter.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.
**) in the case of unpressurized applications in temperatures below $32^{\circ} \mathrm{F}\left(0^{\circ} \mathrm{C}\right)$ please contact our application engineers for assistance!

## Materials

## Standard Application:

- For hydraulic components in mineral oils or medium with good lubricating performance
- Mineral oils and gases

Seal ring: $\quad$ Turcon ${ }^{\circledR}$ T46
Energizer: $\quad$ O-Ring and X-ring seal in NBR 70 Shore A (code N)

## Special Application:

For special applications requiring other material combinations, please contact your local Trelleborg Sealing Solutions sales office.

* At pressures $\mathbf{>} \mathbf{3 0} \mathbf{~ M P a ~ ( 4 , 3 5 0} \mathbf{~ p s i})$ use diameter tolerance H8/f8 (bore/piston) in area of the seal.

The clearances stated as $S$ in the above table are for the Turcon ${ }^{(8}$ AQ-Seal ${ }^{\circledR} 5$ when specified with Slydring ${ }^{\circledR}$ bearings, the diameteral clearance should be reduced.

## Ordering example

Turcon ${ }^{\circledR}$ AQ-Seal ${ }^{\circledR} 5$, complete with O-Ring and X-Ring Seal, recommended range, Series PQ41 (from Table XL)

$$
\begin{array}{ll}
\text { Bore diameter: } & \mathrm{D}_{\mathrm{N}}=2.000 \text { inches } \\
\text { TSS Part No. } & \text { PQ4102000 (from Table XLI) }
\end{array}
$$

Select the material from Table XXXIX. The corresponding code numbers are appended to the TSS Part No. (from Table XLI). Together they form the TSS Article No.
For all intermediate sizes not shown in Table XLI, the TSS Article No. can be determined from the example opposite.

*** For diameters $\geq 100$ inches please consult your Trelleborg Sealing Solutions sales office for special part no.

The sizes listed in bold font are preferred sizes (more likely to be available for immediate shipment). Other dimensions and all intermediate sizes up to 100 inches ( 2540 mm ) diameter can be supplied.

## TURCON ${ }^{\circledR}$ VARISEAL ${ }^{\circledR}$ M2

# - Single-Acting - <br> - Spring-Energized Turcon ${ }^{\circledR}$ U.Cup - 

- Material .
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2

## Description

The Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2 is a single-acting seal consisting of a U-shaped seal jacket and a V-shaped corrosionresistant spring.
The Variseal ${ }^{\circledR}$ M2 has an asymmetric seal profile. The heavy profile of its dynamic lip with an optimized front angle offers good leakage control, reduced friction and long service life.

Figure 46 Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR}$ M2
At low and zero pressure, the metal spring provides the primary sealing force. As the system pressure increases, the main sealing force is achieved by the system pressure and ensures a tight seal from zero to high pressure.
The possibility of matching suitable materials for the seal and the spring allows use in a wide range of applications going beyond the field of hydraulics, e.g. in the chemical, pharmaceutical and foodstuffs industries.
The Variseal ${ }^{\circledR} \mathrm{M} 2$ can be sterilized and is available in a special Hi-Clean version where the spring cavity is filled with a silicone gel preventing contaminants from being entrapped in the seal. This design also works well in applications involving mud, slurries or adhesives to keep grit from packing into the seal cavity and inhibiting the spring action.
For applications with highly viscous media, please contact your local sales office.
Variseal ${ }^{\circledR}$ M2 seals can be installed in grooves to AS4716 and ISO 3771. The seals can only be installed to a limited extent in closed grooves. For installation instructions, see Table VII.

## Advantages

- Resistant to most fluids and chemicals
- Low coefficients of friction
- Stick-slip-free operating for precise control
- High abrasion resistance and dimensional stability
- Can handle rapid changes in temperature
- No contamination in contact with foodstuffs, pharmaceutical and medicinal fluids
- Sterilizable
- Unlimited shelf life

## Application Examples

The Turcon ${ }^{\circledR}$ Variseal ${ }^{\circledR} \mathrm{M} 2$ is the recommended sealing element for all applications requiring stick-slip-free operation as well as chemical resistance against almost all media. Some applications include:

- Valves
- Pumps
- Separators
- Actuators
- Dosing devices

It requires a mating surface of high quality to avoid high wear rates.

## Materials

All materials used are physiologically safe. They have no odor or taste-affecting substances.

The following material combination has proved effective for most fluid applications:

| Seal ring: | Turcon $^{\circledR}$ T 40 |
| :--- | :--- |
| Spring: | Stainless steel, Material No. AISI 301 |
|  | Material code S |

For gas applications use:
Seal ring: T05 or Z80
For use in accordance with the demands of the Food and Drug Administration, suitable materials are available on request.

## COMPACT SEAL PHD/P

- Double-Acting -
- Elastomer-Energized Zurcon ${ }^{\circledR}$ Slipper Seal -
- Material .
- Zurcon ${ }^{\circledR}$ Polyurethane, POM -

## Compact Seal PHD/P

## Description

The PHD/P Seal is a high-pressure heavy-duty piston seal with excellent leakage control and superior extrusion and wear resistance.
The PHD/P seal is a combination of a Zurcon ${ }^{\circledR}$ polyurethane slipper seal energized by an elastomer profile ring and completed with two back-up rings (POM). It is manufactured with a predefined interference fit, which together with the squeeze of the elastomer part ensures a good sealing effect even at low system pressure. At higher pressures the elastomer part is energized by the system pressure and activates the slipper seal in the radial direction.

The back-up rings prevent the slipper seal from extrusion and ensure a long service life even under harsh conditions.

Figure 49 PHD/P Seal

## Advantages

- Simple groove design
- Excellent sealing effect
- Excellent wear resistance
- Increased clearance possible
- Long service life

## Application Examples

The PHD/P Seal is the recommended sealing element for double-acting pistons of hydraulic cylinders working in very harsh conditions. Some applications include:

- Excavators
- Heavy duty cylinders

## Technical Data

Operating conditions
Pressure: Up to 5,800 psi ( 40 MPa )
Peak pressure up to $8,700 \mathrm{psi}(60 \mathrm{MPa})$
Velocity: Up to $1.65 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$
Temperature: $-31^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$
Media: $\quad$ Mineral oil based hydraulic fluids
Clearance: The maximum permissible radial clearance $S_{\text {max }}$ is shown in Table XXXIX, as a function of the operating pressure and functional diameter

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

## Standard Application:

For hydraulic components in mineral oils or medium with good lubricating performance

Seal ring:
Energizer:
Back-up rings:
Material code for the set:

Z2053

## POLYPAC ${ }^{\circledR}$. VEEPAC CH/G1

- Single-Acting -
- Chevron Vee Packing Set -
- With Support and Pressure-Energizing Ring -

## - Material -

- POM, PTFE, Fabric-Reinforced Rubber -

## Veepac CH/G1

## Description

Veepac G1 is a set of fabric-reinforced rings comprised of one support ring, one sealing ring and a pressureenergizing ring. It is a single-acting piston seal.

The support ring, or base ring, is manufactured out of nitrile elastomer with high Shore $A$ hardness and reinforced with impregnated cotton fabric layers for an optimal extrusion resistance.

The intermediate ring - the sealing ring - is a fabricreinforced nitrile elastomer with good resilience characteristics enabling radial deflection under pressure load. The optimum sealing force is applied to the bore to be sealed.

The energizer, or spreader ring, is made of POM or PTFE. Its function is to ensure a uniform pre-load of the seal.

In some specific applications the energizer ring is made out of Acetal resin or Phenolic resin. Please contact your local Trelleborg Sealing Solutions sales office for further details.

Figure 51 Veepac CH/G1

## Advantages

- Exceptional wear resistance
- Pre-load adjustment capability
- Excellent behavior in harsh conditions

## Application Examples

The Veepac seal is recommended for single-acting or double-acting (back-to-back installation) pistons in the following applications:

- Mining equipment
- Excavator cylinders
- Steel mill cylinders
- Presses

## Technical Data

Operating conditions:

Pressure:
Velocity:
Temperature: $\quad-22^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$, depending on material

Media:

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

## Materials

The following material can be delivered:

| Material <br> Set <br> Code | Temperature | Sealing Ring <br> Material | Energizer/ <br> Spreader <br> Ring <br> Material |
| :---: | :---: | :---: | :---: |
| NOOOC | -22 to +266 | Cotton- <br> reinforced NBR | POM |
| VOPOC | -4 to +302 | Cotton- <br> reinforced FKM | PTFE |
| VOPOA | -4 to +392 | Aramidic fiber- <br> reinforced FKM | PTFE |

Highlighted material is standard.

Please contact your local Trelleborg Sealing Solutions sales office for inch dimensions. For metric dimensions, please use the metric catalog.

## COMPACT SEAL D A S TYPE A/B

# - Double-Acting - <br> - Combined Seal and Wear Ring - 

- Material -
- NBR, Polyester Elastomer + POM -

## Compact Piston Seals

## Description

The Compact Seal is a double-acting seal and guide element comprised of an elastomeric profile seal ring, two back-up rings and two guide rings. The profile seal ring seals in both the static and dynamic range while the back-up rings prevent extrusion into the sealing gap. The function of the guide rings is to guide the piston in the cylinder tube and to absorb transverse forces. The design provides a compact seal and guide combination for a closed or split installation groove.

## Designs

The Compact Seal is available in various profile geometries. The choice is normally determined by the existing installation grooves.

## DAS Type A

This type is characterized by the straight, long-sided Lprofiles of the guide rings. Compared with Type B, it exhibits a smaller groove depth with the same cylinder diameter.

Figure 53 D-A-S Compact Seal, Type A

Please contact your local Trelleborg Sealing Solutions sales office for inch dimensions. For metric dimensions, please use the metric catalog.

## DAS Type B

This type is characterized by a Z-shaped back-up ring which forms a chamber with the elastomer seal ring on the inside and is centered on the outside by the guide ring.

For many piston diameters, the width of the guide ring (dimension L2) can be selected due to sideloads.

Due to the larger groove depth, the profile of the seal ring is more rigid than that of Type $A$ and requires higher installation forces.

Figure 54 D-A-S Compact Seal, Type B

## Advantages

- Good sealing effect, also suitable for holding cylinders
- Capable of installation in closed grooves for reduced machining costs
- Economic sealing and guiding solution
- Simple snap installation

## Application Examples

Compact seals are the recommended sealing element for double-acting pistons of hydraulic components such as:

- Machine tools
- Truck cranes
- Forklifts \& handling machinery
- Agriculture equipment

## Technical Data

Operating conditions

| Pressure: | Up to $5,000 \mathrm{psi}(35 \mathrm{MPa})$ peak up to <br> $5,800 \mathrm{psi}(40 \mathrm{MPa})$ |
| :--- | :--- |

| Back-up ring: | Polyester elastomer |
| Guide rings: | POM |
| Set reference: | N8RO |

## POLYPAC ${ }^{\circledR} \cdot$ SELEMASTER DSM

# - Double-Acting - <br> - Combined Seal and Wear Ring - 

- Material -
- NBR + Fiber-Reinforced NBR + POM -

## Description

The piston seal DSM range has been designed to meet the needs of hydraulic equipment operating at high pressures and subjected to severe loading and vibration conditions.

The main sealing element is manufactured in a highly compression set resistant nitrile. The most important qualities of this element is the design of the multiple sealing lips for maximum sealing efficiency and end face configuration, which ensures that the selemaster can tolerate vibrations and severe misalignment.

The two support rings are made in cotton fabric-reinforced nitrile elastomer; the " $U$ " shape is energized when pressure is applied.

The last elements are the two guide rings manufactured in acetal resin which have the function of anti-extrusion rings.

Figure 56 Selemaster design

1) Sealing element
2) Support ring
3) Guide ring

## Advantages

- Effective sealing during vibration and shock loading
- High sealing efficiency
- Extrusion resistance at high pressure

## Application Examples

- Earth moving machines
- Excavators
- Lift platforms

## Technical Data

## Scrapers

## Choice of the Scraper Element

Scrapers are installed in hydraulic cylinders to wipe any dirt, foreign particles, chips, moisture, etc. from the rod as it is retracted into the system. This prevents contamination of the hydraulic fluid, which would damage wear rings, seals and other components.

Single and double-acting scrapers are available, depending on the application and the sealing system. Single-acting scrapers are designed to keep out contamination from the outside; double-acting scrapers have the additional function of regulating the fluid film to avoid any external leakage.

In order to satisfy both the different technical and economic demands, there is a complete range of scrapers with optimized geometries made with high-quality materials.

Before selecting the scraper and the material, it is essential to know all the desired functional parameters. The table on the following pages allows a preliminary choice of the scraper type and material, according to the specific requirements of the application.

Further application information together with specific design and installation instructions for the particular scraper type and material can be found in this catalog.

## Notes on Ordering

All multi-element standard scrapers are supplied as a complete set. The supply includes the scraper and energizing element.

Designs of scrapers no longer contained in this catalog continue to be available. For new applications we recommend the use of the DIN/ISO series listed in this catalog.

The sizes contained in this catalog are generally available from stock and can be supplied on short notice. We reserve the right to modify our article structure without prior notice.

Please do not hesitate to contact your local Trelleborg Sealing Solutions sales office for further information on specific applications and special technical questions.

## ZURCON ${ }^{\circledR}$ SCRAPER DA 22

- Double-Acting .
- Material -
- Zurcon ${ }^{\circledR}$ Polyurethane -

## Zurcon ${ }^{\circledR}$ Scraper DA 22

## Zurcon ${ }^{\circledR}$ Scraper DA 22

## Description

The DA 22 is a double-acting polyurethane scraper for closed groove installation. Significant improvements are achieved in profile geometry and material used if compared with conventional elastomeric scrapers.
The scraper lip is designed so that it effectively removes dirt while leaving only the oil film which is required for correct operation. The radial squeeze is sufficient to remove particles, dust and water.

The scraping lip, which faces inward, it assumes a sealing function even under low pressure. The static seal is achieved by a tight radial fit between the scraper body and the groove.

Figure 1 Scraper DA 22

## Advantages

- Good scraping effect
- Wear resistant, long service life
- Retaining residual oil film
- Standard elements for standardized installation grooves

## Application Examples

Due to the outstanding wiping capacities, the DA22 scraper is recommended wherever there are dusty and humid conditions, especially for the following applications:

- ISO standard cylinders
- Hydraulic industrial cylinders
- Agriculture machinery

## Technical Data

## ZURCON ${ }^{\circledR}$ SCRAPER DA 24

## - Double-Acting -

- Material -
- Zurcon ${ }^{\circledR}$ Polyurethane -

## Zurcon ${ }^{\circledR}$ Scraper DA 24

## Description

The DA 24 is a double-acting scraper made of polyurethane. It is ideal for severe operating conditions and heavy attack of dirt.

Figure 3 Scraper DA 24

The special design of the inward-facing sealing lip contributes to an optimum contact pressure resulting in a very high scraper effect of the residual oil film.
The outward-facing scraper lip leans against the housing. This ensures an optimum sealing force and prevents the penetration of dirt and water across the groove bottom. Also at heavy attacks of dirt and side steering of the piston rod the scraper effect remains stable. The polyurethane material ensures a high service life, also under heavy requirements, and ensures against installation damage.

## Advantages

- Very good scraper effect of the outward lip
- Very good sealing effect of the inward lip
- Reliable at side steering of the piston rod
- Sturdy and wear-resistant
- Simple installation

## Application examples

The scraper DA 24 is especially suitable for applications in:

- Construction machinery
- Agriculture and forestry machinery
- Mobile hydraulics
- High attack of dirt
- Side steering of piston rod

Scraper DA 24 is used in connection with our rod seal system Zurcon ${ }^{\circledR}$ RU-9 and Zurcon ${ }^{\circledR}$ Buffer seal.

## Technical Data

Operating conditions:
Pressure: Max. 725 psi ( 5 MPa )
Velocity: $\quad$ Up to $1.6 \mathrm{ft} / \mathrm{s}(0.5 \mathrm{~m} / \mathrm{s})$
For applications at high strokes and higher speed, please contact your local Trelleborg Sealing Solutions sales office

Temperature: $-31^{\circ} \mathrm{F}$ to $+212^{\circ} \mathrm{F}\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+100^{\circ} \mathrm{C}\right)$
Media: Mineral oil-based hydraulic fluids

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Material

The scraper DA 24 consists of Zurcon ${ }^{\circledR}$ polyurethane material with high wearability, low deformation and high resistance to extrusion.

Standard:
Special Polyurethane:
Zurcon ${ }^{\circledR}$ Z201 93 Shore A
Color: Turquoise

The sizes listed in bold font are preferred sizes (more likely to be available for immediate shipment).
Other dimensions and all intermediate sizes up to 10 inches ( 250 mm ) diameter can be supplied.

Zurcon ${ }^{\circledR}$ Scraper DA 24

## ZURCON ${ }^{\circledR}$ SCRAPER WKE

- Single-Acting -
- Metal-Encased Wiper -

## - Material -

- Zurcon ${ }^{\circledR}$ Polyurethane + Metal -

## Zurcon ${ }^{\circledR}$ Scraper WKE

## Description

The WKE is a polyurethane single-lipped wiper with integrated metal reinforcement for open groove assembly. These are typically used in heavy-duty and medium-duty tough applications that demand keeping the hydraulic system clean. The inner seal edge wipes the fluid film to maximize wiper life, yet prevent oil dripping in conjunction with the primary seal.

Figure 5 Scraper WKE

## Advantages

- Space-saving construction
- High wear resistance / long life
- Simple, easy construction groove
- Firm fit in the groove due to metallic press fit
- Accurate fluid film control

## Application Examples

Due to their outstanding wiping capacities WKE scrapers are recommended wherever there are dusty and humid conditions and especially for the following applications:

- Mobile hydraulic machinery
- Agriculture machinery
- Construction machinery
- Lift trucks

## Technical Data

| Velocity: | Up to $3 \mathrm{ft} / \mathrm{s}(1 \mathrm{~m} / \mathrm{s})$ |
| :--- | :--- |
| Temperature: | $-31^{\circ} \mathrm{F}$ to $+212^{\circ} \mathrm{F}\left(-35^{\circ} \mathrm{C}\right.$ to $\left.+100^{\circ} \mathrm{C}\right)$ |
| Media: | Mineral oil-based hydraulic fluids |
| Groove type: | Open |

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

Other dimensions and all intermediate sizes up to 10 inches (250 mm ) diameter can be supplied.

Zurcon ${ }^{\circledR}$ Scraper WKE

## SCRAPER DA 17

## - Double-Acting -

- Material .
- Elastomer -

## Scraper DA 17

## Description

The DA 17 is a molded double-acting elastomer scraper. It has two geometrically different scraper lips.

Figure 7 Scraper DA 17
The scraper is used for reciprocating piston rods and plunger pistons in hydraulic cylinders. It prevents the penetration of dirt into the system and holds back the residual oil film from the extending piston rod.
The scraper is preferably used in conjunction with our rod seals with a hydrodynamic back-pumping function.

## Advantages

- Low friction
- Good scraping effect both inwards and outwards
- Simple, small installation groove
- Compact design
- Easy installation and removal without tools

## Technical Data

Velocity:
Temperature:
Media:

Up to $3 \mathrm{ft} / \mathrm{s}(1 \mathrm{~m} / \mathrm{s})$
$-22^{\circ} \mathrm{F}$ to $+230^{\circ} \mathrm{F}\left(-30^{\circ}\right.$ to $\left.+110^{\circ} \mathrm{C}\right)$
Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids (HFA, HFB, HFC), water, air, etc.

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Material

Standard material: NBR, 90 Shore A

## Installation Recommendation (Inch Series)

Up to .7 inches ( 18 mm ) diameter we recommend a split groove.

## TURCON ${ }^{\circledR}$ EXCLUDER ${ }^{\circledR} 2$

# - Double-Acting - <br> - O-Ring-Energized Scraper - 

- Material -
- Turcon ${ }^{\circledR}$ or Zurcon ${ }^{\circledR}+$ Elastomer .

## Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR} 2$

## Description

The Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR} 2$ is a double-acting scraper with two geometrically different scraper lips which are installed back-to-back. The Excluder ${ }^{\circledR} 2$ is installed together with an elastic O-Ring in one groove. The scraper function is performed by the Excluder ${ }^{\circledR}$ 2. The O-Ring maintains the pressure of the scraper lips against the sliding surface and can compensate for any deflections of the piston rod.

Figure 9 Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR} 2$

The Excluder ${ }^{\circledR} 2$ has two functions:

- Scrape contaminants from the retracting piston rod
- Hold back the residual oil film on the extending piston rod on the medium side
The Excluder ${ }^{\circledR} 2$ is used with the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 K$, i.e. seals with a hydrodynamic back-pumping function.

## Advantages

- Outstanding sliding properties
- Stick-slip-free
- Can compensate for deflections of the piston rod or plunger
- Space-saving construction
- Very good scraping effect against outside contaminants, even with firmly adhered dirt, etc.
- Very good scraping effect from the inside against the residual oil film adhering to the surface of the piston rod
- Very high resistance to hydraulic media
- Available for all diameters up to 102.000 inches $(2,600$ mm ) (Turcon ${ }^{\circledR}$ ) and up to 86.000 inches ( $2,200 \mathrm{~mm}$ ) (Zurcon ${ }^{\text {® }}$ )

## Technical Data

Velocity:
Temperature:

## Media:

Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids, environmentally safe hydraulic fluids (bio-oils), water, air and others, depending on the O-Ring material

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

## Materials

The following material combination has proven effective for most applications:
Excluder ${ }^{\circledR}$ :
Turcon ${ }^{\circledR}$ T46
O-Ring:
NBR, 70 Shore A

For other applications, other material combinations as listed in Table X, may also be used.

## Design and Installation Instructions

Excluder ${ }^{\circledR} 2$ scrapers can be installed in split and closed grooves (For installation dimensions, see table XI). Installation in closed grooves depends on the rod diameter, profile cross-section of the scraper and on the cord cross section of the corresponding O-Ring.

Table X Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ Materials for Excluder ${ }^{\circledR} 2$

## TURCON ${ }^{\circledR}$ EXCLUDER ${ }^{\circledR} 5$

# - Double-Acting - <br> - O-Ring-Energized Scraper - 

- Material -
- Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$.

## Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR} 5$

## Description

The Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR} 5$ is a patented double-acting scraper with two geometrically different scraper lips which are installed back-to-back. The scraper is installed together with an O-Ring as the elastic energizing element in one groove. The scraper function is performed by the Excluder ${ }^{\text {® }} 5$. The O-Ring maintains the pressure of the scraper lips against the sliding surface and can compensate for deflections of the piston rod.

Figure 11 Turcon ${ }^{\circledR}$ Excluder $^{\circledR} 5$
The Excluder ${ }^{\circledR} 5$ has two functions:

- Scrape contaminants from the retracting piston rod
- Hold back the residual oil film on the extending piston rod on the medium side

Excluder ${ }^{\circledR} 5$ is preferably used with the Turcon ${ }^{\circledR}$ Stepseal ${ }^{\circledR} 2 \mathrm{~K}$, our rod seal with a hydrodynamic backpumping function. In contrast to the Excluder ${ }^{\circledR}$ 2, the Excluder ${ }^{\circledR} 5$ is used for heavy duty applications such as construction machinery, presses, etc.

## Advantages

- Outstanding sliding properties
- Stick-slip-free (Turcon ${ }^{\circledR}$ material)
- Tough scraper for heavy-duty operation
- Can compensate for deflections of the piston rod or plunger
- Very good scraping effect even against firmly adhered dirt, etc.
- Very good scraping effect from the inside against the residual oil film adhering to the surface of the piston rod
- Very high resistance to hydraulic media
- Available for all diameters up to 102.000 inches $(2,600$ mm ) (Turcon ${ }^{\circledR}$ ), up to 86.000 inches $\left(2,200 \mathrm{~mm}\right.$ ) (Zurcon ${ }^{\circledR}$ )

## Technical Data

Velocity:

Temperature:

Media:
$50 \mathrm{ft} / \mathrm{s}(15 \mathrm{~m} / \mathrm{s})$ for Turcon ${ }^{\circledR}$ materials $6.5 \mathrm{ft} / \mathrm{s}(2 \mathrm{~m} / \mathrm{s})$ for Zurcon ${ }^{\circledR}$ materials
$-49^{\circ} \mathrm{F}$ to $+392^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+200^{\circ} \mathrm{C}\right)$ (Turcon ${ }^{\text {® }}$ )
$-49^{\circ} \mathrm{F}$ to $+212^{\circ} \mathrm{F}\left(-45^{\circ} \mathrm{C}\right.$ to $\left.+100^{\circ} \mathrm{C}\right)$
(Zurcon ${ }^{\text {® }}$ )
(depending on O-Ring material)
Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids, environmentally safe hydraulic fluids (bio-oils), water, air and others, depending on the scraper and O-Ring material

## Important Note:

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

## Materials

The following material combination has proven effective for most applications:
Excluder ${ }^{\circledR}$ : Turcon ${ }^{\circledR}$ T46
O-Ring: NBR, 70 Shore A
Set Code:
T46N

For other applications, other material combinations as listed in Table XIII may also be used.

## Design and Installation Instructions

Excluder ${ }^{\circledR} 5$ scrapers can be installed in split and closed grooves (For installation dimensions, see table XIV).
Installation in closed grooves is depends on the rod diameter, profile cross-section of the scraper and on the cross section of the corresponding O-Ring.

## Turcon ${ }^{\circledR}$ Excluder ${ }^{\circledR} 5$

Table XIII Turcon ${ }^{\circledR}$ and Zurcon ${ }^{\circledR}$ Materials for Excluder ${ }^{\circledR} 5$

| Material, Applications, Properties | Code | O-Ring Material | Code | O-Ring Operating Temp.* ${ }^{\circ} \mathrm{F}$ | Mating Surface Material | Speed Ft/s max. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Turcon ${ }^{\circledR}$ T46 <br> Standard material for hydraulics, high compressive strength, good sliding and wear properties, BAM tested. <br> Bronze-filled <br> Color: grayish to dark brown | T46 | NBR - 70 Shore A | N | -22 to +212 | Steel, hardened <br> Steel, chrome-plated | 50 |

\section*{ZURCON \({ }^{\circledR}\) SCRAPER WAE}

- Single-Acting -
- Material -
- Zurcon \({ }^{\circledR}\) Polyurethane -

\section*{Zurcon \({ }^{\circledR}\) Scraper WAE}

\section*{Description}

The WAE is a single-acting polyurethane scraper.

Figure 13 Scraper WAE

The special feature of this scraper is an additional support on the inner surface. It prevents tilting or twisting of the scraper in the groove. At the same time this support improves the firm seating in the groove, preventing the penetration of impurities via the back of the scraper. This represents a technical improvement compared to similar scraper types.

\section*{Advantages}
- Simple groove design
- Very good scraping effect, wear-resistant
- No tilting or twisting in the groove
- Simple installation
- Flush fitting with the outer surface

\section*{Technical Data}

Velocity:
Temperature:
Media:

\section*{Important Note:}

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also dependent on medium.

\section*{Material}

The standard material is a wear-resistant Zurcon \({ }^{\circledR}\) polyurethane.

Standard material: Polyurethane, 93 Shore A Material No. Z201

Color: Turquoise

\section*{SCRAPER WRM}

- Single-Acting -
- Material -
- NBR Elastomer -

\section*{Scraper WRM}

\section*{Scraper WRM}

\section*{Description}

Wipers are essential components of any hydraulic or pneumatic equipment.

These are protection components for axial moving rods; they ensure that foreign matter is not introduced into the system, avoiding costly wear and damage to all the internal components including seals.
WRM scrapers are manufactured in nitrile elastomer with precision machined wiper lip, which produces a very effective wiping action.

Figure 16 Scraper WRM

\section*{Advantages}
- Space-saving construction
- Low cost, economical solution
- Simple, easy construction groove
- Easy installation and removal without tools

\section*{Application Examples}

Due to their outstanding wiping capacities WRM scrapers are recommended wherever there are dusty and humid conditions and especially for the following applications:
- Valve spindles
- Slide valves
- Hydraulic cylinders
- Agriculture machinery

\section*{ZURCON \({ }^{\circledR}\) SCRAPER SWP}

\title{
- Single-Acting - \\ - Metal-Encased Wiper -
}

\section*{- Material .}
- Zurcon \({ }^{\circledR}\) Polyurethane + Metal -

\section*{Zurcon \({ }^{\circledR}\) Scraper SWP}

\section*{Description}

The SWP is a polyurethane single-lipped scraper with integrated metal reinforcement for open groove assembly. It is typically used in severe applications where there is abrasion due to solid matter on the rod surface.

Figure 18 Scraper SWP

\section*{Advantages}
- Space-saving construction
- Simple small installation groove
- Firm fit in the groove due to metallic press fit
- At regreasing of drag bearing, the scraper lip opens at low overpressure; old grease can escape
- High wear resistance / long life

\section*{Application Examples}

Due to their outstanding wiping capacities SWP scrapers are recommended wherever there are dusty and humid conditions and especially for the following applications:
- Mobile hydraulic machinery
- Construction machinery
- Link pin seals
- Lift trucks
- Truck cargo cranes
- Agriculture machinery

\section*{Technical Data}

\section*{Zurcon \({ }^{\circledR}\) Scraper SWP}

\section*{SCRAPER WSA}

\title{
- Single-Acting - \\ - Metal-Encased Wiper -
}
- Material -
- NBR and Metal -

\section*{Scraper WSA}

\section*{Description}

The WSA is a mold-vulcanized single-acting elastomer scraper with integral metal reinforcement for open groove assembly. In conjunction with the scraper interference, an exact fit is obtained in the housing.

Figure 20 Scraper WSA

\section*{Advantages}
- Space-saving construction
- Low cost, economical solution
- Simple, easy construction groove
- Firm fit in the groove due to metallic press fit

\section*{Application Examples}
- Hydraulic cylinders
- Agriculture machinery
- Construction machinery
- Lift trucks
- Mobile hydraulics

\section*{Technical Data}

Operating conditions
Velocity: \(\quad\) Up to \(3 \mathrm{ft} / \mathrm{s}(1 \mathrm{~m} / \mathrm{s})\)
Temperature: \(\quad-22^{\circ} \mathrm{F}\) to \(+230^{\circ} \mathrm{F}\left(-30^{\circ} \mathrm{C}\right.\) to \(\left.+110^{\circ} \mathrm{C}\right)\)
Media: Mineral oil-based hydraulic fluids, polyglycol-water emulsions, water-oil emulsions

Groove type: Open

\section*{Important Note:}

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.
Temperature range also dependent on medium.

\section*{Materials}

\section*{Metal Scraper}

\section*{Description}

The metal scraper is a single-acting special scraper with two different scraper lips - a thin metallic lip and an elastomer lip. The two scraper lips are arranged in tandem behind one another in a compact metal housing.

Figure 22 Metal Scraper
The metal scraper lip is designed to remove firmly adhered soil and ice particles. The secondary lip of elastomer material enhances the overall scraping effect, i.e. fine sand grains, water and similar foreign matter are reliably scraped off. Both scraper lips have a smaller diameter than the nominal diameter of the piston rod, ensuring a tight fit. The metallic lip is guided in the radial direction and can easily follow any possible deflections of the piston rod.

\section*{Advantages}
- Very good scraping effect, even with firmly adhering dirt, e.g. mud, ice
- Very abrasion resistant
- Tight fit in the groove due to the metal case
- Easy installation in open grooves

\section*{Choice of Slydring \({ }^{\circledR}\)}

The function of Slydring \({ }^{\circledR}\) is to absorb the sideload forces which occur in the piston and/or rod of a hydraulic cylinder or other devices. At the same time they eliminate metallic contact between the sliding parts of the cylinder, e.g. piston and cylinder barrel or rod and cylinder head. Nonmetallic guide rings offer major benefits compared with the traditional metallic guides:
- Cost efficient production
- High load bearing capacity
- Eliminates local stress concentrations
- Wear-resistant, long service lives
- Metal/plastic pairing eliminates fretting and seizure
- Favourable friction behaviour
- Damping of mechanical vibrations
- Good wiping effect, embedding of foreign particles possible
- Protection of the seal against "dieseling"
- Free choice of material of the metal components as guiding properties are no longer required
- Eliminates hydrodynamic pressure problems in the guide system
- Simple closed groove, easy installation
- Low service costs

\section*{Materials}

In view of the different specific demands made on piston and rod guides, various Slydring \({ }^{\circledR}\) materials are available:
- Turcite \({ }^{\circledR}\) materials are highly wear-resistant, low friction, specially modified materials for low to medium duty with limited radial forces
- HiMod \({ }^{\circledR}\) materials with friction-reducing fillers for medium to heavy duty radial forces
- Orkot \({ }^{\circledR}\) fabric composite materials for heavy duty and high radial forces
In order to choose the most suitable Slydring \({ }^{\circledR}\), it is first necessary to know all the required functional parameters. Table I can be used to make an initial preselection of the Slydring \({ }^{\circledR}\) and the materials to meet the demands of the application.
Before the final choice of Slydring \({ }^{\circledR}\) and material is made, the details and information must be checked in the relevant data sheets of Slydring \({ }^{\circledR}\) materials.

\section*{Design type}

Slydring \({ }^{\circledR}\) have a rectangular cross-section with rounded or chamfered edges, thus preventing impermissible edge forces in the corner radii of the grooves. The chamfers also serve to facilitate installation, e.g. when inserting into the cylindrical tube or guide bush.
Slydring \({ }^{\circledR}\) is supplied ready to fit with the gap necessary (dimension Z or Z1) for their function. The ring ends are finished as standard with an angle cut.
For further details, please refer to Table .

Figure 1 Type of cut
Table I Forms of Supply for Slydring \({ }^{\text {® }}\)

\hline
\end{tabular}

Table II Selection Criteria for Slydring \({ }^{\text {® }}\)

Slydring \({ }^{\circledR}\) has a tightly controlled thickness to maximize its load carrying capability and extend the life of the seals. A precision wall thickness tolerance of \(.002^{\prime \prime}\) is achieved on our standard product in this catalog. Our HiMod \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) HM803 and HM852 are available with ultra-tight tolerance wall thickness of 0.124-0.125 inches and loose tolerance of 0.122 - 0.125 inches. Wall thicknesses and sizes not mentioned in this catalog are available. Contact you local Trelleborg Sealing Solutions sales office for further information.

\section*{Table III Radial Clearance}
\begin{tabular}{|c|c|c|}
\hline Bore Diameter & min. & max. \\
\hline \(.20-.79\) & .20 & .30 \\
\hline \(.80-3.99\) & .25 & .40 \\
\hline \(4.00-9.99\) & .30 & .60 \\
\hline \(10.00-19.99\) & .40 & .80 \\
\hline \(20.00-39.99\) & .50 & 1.10 \\
\hline\(>40.00\) & .60 & 1.20 \\
\hline
\end{tabular}

Table IV Surface Roughness
\begin{tabular}{|l|c|c|c|c|c|}
\hline \multirow{2}{*}{ Parameter } & \multicolumn{4}{|c|}{ Mating surface } & Groove Surface \\
\cline { 2 - 5 } & Turcite \(^{\circledR}\) Materials & Zurcon \(^{\circledR}\) Materials & HiMod \(^{\circledR}\) Materials & Orkot \(^{\circledR}\) Materials & \\
\hline \(\mathrm{R}_{\text {max. }}\) & \(.63-4.00\) & \(1.00-4.00\) & \(1.00-4.00\) & \(1.00-4.0\) & \(<16.0\) \\
\hline \(\mathrm{R}_{\mathrm{z}}\) DIN & \(.40-2.50\) & \(.63-2.50\) & \(.63-2.50\) & \(.63-2.50\) & \(<10.0\) \\
\hline \(\mathrm{R}_{\mathrm{a}}\) & \(.005-.40\) & \(.10-.40\) & \(.10-.40\) & \(.10-.40\) & \(<2.50\) \\
\hline
\end{tabular}

Slydring \({ }^{\circledR}\) also allows foreign particles to be wiped away rather than being squeezed between the metal components. The slot ' \(Z 1\) ' allows fluid to pass across the ring thus preventing fluid pressure buildup which might cause extrusion of the guide ring. To ensure the ring cannot escape out of the groove it is recommended to observe the following radial gap sizes as maximum:
- .020 for .060 thickness
- .035 for .125 thickness

\section*{Important Note:}

The above stated limits for pressure and speed are maximum values individually. Friction heat generated by the combination of pressure and speed may cause local heat buildup. Care should be taken not to apply high values for pressure and speed at the same time.

\section*{Design Instructions}

\section*{Selection of Slydring \({ }^{\text {® }}\)}

An initial choice can be made for various applications by checking the Selection Criteria for Slydring \({ }^{\circledR}\) in Turcite \({ }^{\circledR}\), Zurcon \({ }^{\circledR}\), HiMod \(^{\circledR}\) or Orkot \({ }^{\circledR}\), see Table I and the pages , , 10, and 12.

The values for the load on the Slydring \({ }^{\circledR}\) are valid for a load distribution as illustrated in Figure. The flexibility of the materials ensures a relatively constant specific load, irrespective of the size of the radial forces \(F\), as with increasing radial loading, the guide surface subjected to the load increases also.
The radial forces which occur can vary within wide ranges and cannot always be calculated exactly in advance. For such cases, a safety factor of at least 2 is recommended when calculating (see calculation example).

Figure 2 Load distribution
The large effective bearing area of non-metallic Slydring \({ }^{\circledR}\) gives low maximum contact pressure.

\section*{Dimensioning of Slydring \({ }^{\text {® }}\)}

The radial bearing pressure and the resulting elastic deflection are important parameters in the design of the Slydring \({ }^{\circledR}\). The radial offset resulting from the dimensional tolerances, deflection and wear should always be less than the smallest gap to be sealed by the system.
On request, we are willing to carry out dimensioning calculations for specific applications.
A rough estimate of the number and width of Slydring \({ }^{\circledR}\) required can be calculated using the following formula:

Slydring \(^{\circledR}\) width Ttotal \(=\frac{F \times f}{d_{N} \times P r}\) where:
\(\mathrm{F}=\) Maximum radial load [ N ]
\(f=\) Safety factor
\(\mathrm{d}_{\mathrm{N}}=\) Rod diameter [mm]
\(\operatorname{Pr}=\) Radial Slydring \({ }^{\circledR}\) pressure \(\left[\mathrm{N} / \mathrm{mm}^{2}\right]\)
Example:
\(\mathrm{d}_{\mathrm{N}}=60 \mathrm{~mm}\)
\(\mathrm{F}=40.000 \mathrm{~N}\)
\(\mathrm{t}=40^{\circ} \mathrm{C}\)
\(f=2\)
Slydring \({ }^{\circledR}\) material Orkot \({ }^{\circledR} \mathrm{C} 380\)
\(\operatorname{Pr}_{\text {per. }} \quad 100 \mathrm{~N} / \mathrm{mm}^{2}\)
\(T_{\text {total }}=\frac{40.000 \times 2}{60 \times 100}=13.3 \mathrm{~mm}\)

From Table, a groove with a width of 15 mm or 2 grooves with widths of 9.7 mm are selected. The installation of two strips is recommended as this gives a wider guide length.
Selected:
2 strips Series GR69 with a groove width \(L_{2}=9.7 \mathrm{~mm}\)
When calculating the width of Slydring \({ }^{\circledR}\) it is recommended to use a safety factor \(\mathrm{f}=2\).

\section*{Turcite \({ }^{\circledR}\) Slydring \({ }^{\circledR}\)}

\section*{Description}

Turcite \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) is used as piston and rod guides due to their outstanding friction behaviour, stick-slip free running and good resistance to high temperatures and chemicals.

\section*{Design}

Turcite \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) is also available as cut-to-length strips or in bulk rolls. Please contact your local Trelleborg Sealing Solutions sales office for more information.

\section*{Advantages}
- No stick-slip effect when starting for smooth operation even at very low speeds
- Minimum static and dynamic friction coefficient for low operating temperature and energy loss
- Suitable for non lubricating fluids depending on Turcite \({ }^{\circledR}\) material for optimum design flexibility
- High wear resistance ensures long service life
- Installation grooves according to ISO 10766
- Suitable for most hydraulic fluids in relation with the majority of modern hardware materials and surface finish depending on material selected.
- Suitable for new environmentally safe hydraulic fluids
- The embedding of foreign particles is enhanced
- Good damping effect, absorbs vibrations

\section*{Technical Data}

The Turcite \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) with angle cut is recommended for reciprocating movements
\begin{tabular}{ll} 
Velocity: & Up to \(10.8 \mathrm{ft} / \mathrm{s}\) \\
Temperature: & \(-71^{\circ} \mathrm{F}\) to \(+302^{\circ} \mathrm{F}\)
\end{tabular}
\begin{tabular}{cl} 
Media: & \begin{tabular}{l} 
Mineral Oil based Hydraulic fluids, \\
barely flammable hydraulic fluids, \\
environmentally safe hydraulic fluids \\
(biological degradable oils), water, \\
air and others. Depending on the \\
Turcite \({ }^{\text {® }}\) material compatibility.
\end{tabular} \\
Clearance: \(\quad\)\begin{tabular}{l} 
The maximum permissible radial \\
clearance smax is depending on the \\
actual sealing system.
\end{tabular}
\end{tabular}

Radial Slydring \({ }^{\circledR}\)
pressure Pr: \(\quad\) Max. 2,175 psi at \(77^{\circ} \mathrm{F}\)
Max. 1,160 psi at \(248^{\circ} \mathrm{F}\)

\section*{Materials}

\section*{Standard Application:}
- For hydraulic components with reciprocating movement in mineral oils or medium with good lubricating performance. Low friction, high resistance to wear, heat and chemicals:
Turcite \({ }^{\circledR}\) T47 (bronze filled)
Color: Turquiose
Material code: T47

\section*{Special Application:}
- For lubricated and poor lubricated moving components: Water hydraulics and soft metal surfaces:
Turcite \({ }^{\circledR}\) T51 (carbon filled)
Color: Brown
Material code: T51
- For short stroke movements, non-lubricating fluids, water hydraulics, soft metal surfaces or pneumatic, applications requiring self-lubricating sealing materials:
Turcite \({ }^{\circledR}\) T59 (carbon fiber filled)
Color: Brown
Material code: T51
With the Turcite \({ }^{\circledR}\) materials it must be taken into account that the permissible surface pressure decreases with increasing temperatures. The load bearing ability for dynamic applications in practice is dependent primarily on the operating temperature. This should therefore generally not exceed \(302^{\circ} \mathrm{F}\left(150^{\circ} \mathrm{C}\right)\).

Table V Installation in Closed Grooves Minimum Diameter for Turcite \({ }^{\circledR}\) Slydring
\begin{tabular}{|l|l|l|}

\hline \(\mathbf{2 . 0 0 0}\) & 2.000 & 2.500 \\
\hline \(\mathbf{2 . 5 0 0}\) & 2.000 & 2.750 \\
\hline
\end{tabular}

\section*{Zurcon \({ }^{\circledR}\) Slydring \({ }^{\circledR}\)}

\section*{Zurcon \({ }^{\circledR}\) Z80}

Z80 is a UHMW-PE (ultra high molecular weight polyethylene) material which meets the requirements in FDA 21 CFR 177:1520 and is therefore recommended for use in foodstuff applications. The material is also preferred for use in water hydraulics and pneumatics due to excellent friction and wear properties.
Color: White
Material code: Z80

\section*{Advantages:}
- Good lubrication and wear performance
- Self-lubricating
- Low friction value
- No water absorption
- In compliance with FDA
- Excellent resistance to chemicals
- High wear resistance.

\section*{Technical Data}

Radial Slydring \({ }^{\text {® }}\)
pressure Pr: Max. 3,625 psi at \(77^{\circ} \mathrm{F}\)
Max. 1,450 psi from \(140^{\circ} \mathrm{F}\)
to \(176^{\circ} \mathrm{F}\)

\section*{HiMod \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) for Piston and Rod}

\section*{Description}

HiMod \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) is made in special, modified thermoplastic material and can be used in hydraulic cylinders for medium to high loads. HiMod \({ }^{(2)}\) HM803 and HiMod \({ }^{\circledR}\) HM852 are two of many custom blended materials from the Hydro Components family of premium nylon materials. Three different standard grades of material are available:

HiMod \({ }^{\circledR}\) HM061: A special glass fiber-reinforced polyacetal

HiMod \({ }^{\circledR}\) HM803: A special glass fiber-reinforced heat-stabilized polyamid
HiMod \({ }^{\circledR}\) HM852: A special glass fiber-reinforced heat-stabilized polyamid with PTFE

\section*{Materials}

\section*{HiMod \({ }^{\circledR}\) HM061}

HiMod \({ }^{\circledR}\) HM061 is a polyacetal (POM) based material with glass fibers.
Color: Tan
Material code: HM061

\section*{Advantages:}
- Favorable price/performance ratio
- High compressive strength
- Easy installation on pistons and glands (gland bore < 1.50 inches)
- High wear resistance
- Water absorption 0.2 \%
- High stiffness

\section*{Technical Data}

Velocity, reciprocating: Max. \(2.65 \mathrm{ft} / \mathrm{s}\)
Temperature: \(\quad-40^{\circ} \mathrm{F}\) to \(+230^{\circ} \mathrm{F}\)

Radial Slydring \({ }^{\text {® }}\)
pressure Pr: \(\quad\) Max. 5,800 psi at \(77^{\circ}{ }^{\circ}\)
Max. 3,625 psi \(>140^{\circ} \mathrm{F}\)

\section*{HiMod \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) for Piston and Rod}

\section*{HiMod \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) HM803}

Hydro-Components proprietary heat-stabilized polyamid material with special glass fibers for improved bearing characteristics and proven performance
Color: Dark Gray
Material code: HM803

\section*{Advantages:}
- Excellent price/performance ratio
- High compressive strength even at high temperatures
- High wear resistance
- Easy installation on pistons and glands (Use . 060 wall for bores under 1.50 inches)
- Low Friction

\section*{Technical Data}

Velocity, reciprocating:
Max. \(3.3 \mathrm{ft} / \mathrm{s}\)
Temperature:
\(-40^{\circ} \mathrm{F}\) to \(+275^{\circ} \mathrm{F}\)
Radial Slydring \({ }^{\text {® }}\) pressure Pr:

Max. 10,877 psi at \(140^{\circ} \mathrm{F}\)
Max. 5,800 psi \(>140^{\circ} \mathrm{C}\)
Water Absorption: < 1\%

\section*{HiMod \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) HM852}

Hydro-Components proprietary heat-stabilized polyamid material with special glass fibers plus PTFE lubricant for applications with marginal lubricity
Color: Dark Gray
Material code: HM852

\section*{Advantages:}
- Excellent price/performance ratio
- High compressive strength even at high temperatures
- High wear resistance
- Easy installation on pistons and glands (Use .060 wall for bores under 1.50 inches)
- Lower friction
- For operation under poor lubrication.

\section*{Technical Data}

Velocity, reciprocating: Max. \(3.3 \mathrm{ft} / \mathrm{s}\)
Temperature: \(\quad-40^{\circ} \mathrm{F}\) to \(+275^{\circ} \mathrm{F}\)
Radial Slydring \({ }^{\circledR}\) pressure Pr:

Max. 10,877 psi at \(140^{\circ} \mathrm{F}\)
Max. 5,800 psi > \(140^{\circ} \mathrm{F}\)

\section*{Orkot \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) for Piston and Rod}

\section*{Description}

Orkot \({ }^{\circledR}\) Slydring \({ }^{\circledR}\) of fabric-reinforced composite materials is used in hydraulic cylinders exposed to high loads that can occur, e.g. in mobile hydraulics and presses. The high compressive strength, good sliding behavior and the exceptional wear resistant properties ensure a long service life.

Slydring \({ }^{\circledR}\) of Orkot \({ }^{\circledR}\) fabric composite materials is produced as standard from tubular material. It is manufactured with an angle cut and already has the necessary gap Z1

For large diameters > 12 inches rings can be cut from Orkot \({ }^{\circledR}\) C320, C380 strip material. This offers economical solutions for non-standard diameters or when quantities are limited.

\section*{Materials}

\section*{Orkot \({ }^{\circledR}\) C320}

Orkot \({ }^{\text {® }}\) C320 is a fabric composite material made of a thermosetting polymer, reinforced by a fine plastic mesh and lubricant additives impregnated throughout the material. It has a very high resistance to wear, good dryrunning properties and dampens vibrations.
Color: dark gray
Material code: C320

\section*{Orkot \({ }^{\circledR}\) C380}

Orkot \({ }^{\circledR}\) C380 is the standard material, this turquoise colored composite is a further development of the proven C320. It is most versatile; It is suitable for all commonly used hydraulic fluids such as mineral or synthetic oils, as well as water based fluids. It is an excellent electrical insulator and features enhanced sliding properties in various media.
Color: Turquoise
Material code: C380

\section*{Orkot \({ }^{\circledR}{ }^{\text {C }} 932\)}

Orkot \({ }^{\circledR}\) C932 is a composite of phenolic resin impregnated into a fine cotton fabric. The material stiffness is higher than C380 I C320. The use in water-based fluids is not recommended.
Color: yellow-brown
Material code: C932

\section*{Technical Data}

Velocity:
Up to \(3.3 \mathrm{ft} / \mathrm{s}\), with reciprocating movements

Temperature: \(\quad-105^{\circ} \mathrm{F}\) to \(+250^{\circ} \mathrm{F}\)
Pr under dynamic conditions
(C380, C320, C932):
max. 14,500 psi at \(77^{\circ} \mathrm{F}\)
max. 7,250 psi \(>140^{\circ} \mathrm{F}\)
Ultimate compressive strength
(C380, C320):
(C932):
max. \(>43,500\) psi
max. 37,709 psi

\section*{Advantages}
- Dimensionally stable and vibration absorbing
- Even distribution of high radial forces
- Good sliding and dry running properties
- High wear resistance
- Good wiping effect
- Long service life.

\section*{DUALSEAL}

\section*{Dualseal}

\section*{Description}

In current hydraulic cylinder design, O-Ring or O-Ring/Backup Ring combinations are mainly used as static seals. However, this sealing solution hides the risk that during assembly the O-Ring may become twisted and that the position of the Back-up Ring is not optimal. This solution also exhibits weaknesses with regard to pressure pulsation and the ingress of dirt.
The Dualseal as a single component static hydraulic seal offers a good alternative in such cases.

\section*{Advantages}

Compared with the O-Ring / Back-up Ring combination, the Dualseal offers the following advantages:
- High resistance to twisting
- Easy assembly
- Long service life
- High extrusion resistance

Table I Surface finish
\begin{tabular}{|l|l|l|l|}
\hline Type of load & Surface & \(\mathbf{R t} \mu \mathbf{m}\) & \(\mathbf{R z} \mu \mathbf{m}\) \\
\hline \multirow{3}{|c|}{ Radial-static } & Mating surface & \(\mu \mathbf{m}\) \\
\hline & \begin{tabular}{l} 
Groove surface \\
(groove diameter, groove flanks)
\end{tabular} & \(\leq 10.0\) & \(\leq 1.6\) \\
\hline
\end{tabular}

\section*{Lead-in chamfers}

Groove depth \(<.12\) inches \((3 \mathrm{~mm}) \Rightarrow .12\) inches \(\times 15^{\circ}\) ( 3 mm \(\times 15^{\circ}\) )
Groove depth >. 12 inches \((3 \mathrm{~mm}) \Rightarrow .20\) inches \(\times 15^{\circ}(5 \mathrm{~mm}\) \(\times 15^{\circ}\) )

\section*{Preferred sealing gap}

Bore H8
Gland g6
Due to the high extrusion resistance of the seal a radial sealing gap ( S ) of .008 inches ( 0.2 mm ) can be realised.
In case of low temperature applications deviations of the gland to the bore and rod should be avoided.

\section*{Technical data}

Operating pressure: Max. 7,500 psi (Max. 50 MPa )
Operating temperature: \(-31^{\circ} \mathrm{F}\) to \(+230^{\circ} \mathrm{F}\)
\(\left(-35^{\circ} \mathrm{C}\right.\) to \(\left.+110^{\circ} \mathrm{C}\right)\)

\section*{Important Note:}

The application limits for pressure and temperature given in this catalogue are maximum values.
During practical applications it should be remembered that due to the interaction of operating parameters the maximum values must be set correspondingly lower.

\section*{Material}

Standard material: Zurcon \({ }^{\circledR}\) Z20 polyurethane 93 shore A, turquoise. Suitable for all HL and HLP hydraulic fluids.

\section*{Applications}

The Dualseal allows general use in hydraulic cylinders:
- Fork lifts
- Mobile hydraulics
- Industrial hydraulics
- Machine tools
- Injection molding machines
- Hydraulic presses
- Cartridge valves

Dualseal performs leak-free and is highly extrusion resistant under the following test conditions:
\begin{tabular}{|l|c|c|}
\hline & \begin{tabular}{c} 
High \\
pressure \\
test
\end{tabular} & \begin{tabular}{c} 
Pressure \\
pulsation \\
